"The Wanderer" <wandererstill@yahoo.com>:
>Hm, how hard would it be to rewrite your image manager for KMK/JZ?
>Anyone? Jerzy?

I have no idea how the KMK/JZ interface works. If you strip out all the MyIDE specific stuff from my program you aren't really left with much. You would probably be better off doing one from scratch that is built from the ground up to support that interface and the way it treats its partitions.

I wrote my program using a C cross compiler (http://www.cc65.org/).

Hello. Yes, I was making a parody of the spam posting about a hot 22
year old (presumably female, and presumably nude somehow).

On 31 Dec 2004 23:03:18 GMT, Greg.Goodwin@family-news.org wrote:

Sector copying made it possible to copy it, but alas, still cannot be
read.
:(It was part 20 of a ongoing series from Atari BBS stories back in
the
80's. Hope I can figure out something. <

You were able to sector copy the disk, but still can't read it? If you
would like for me to take a look at it, send me an ATR image. But
perhaps you've fixed it by now.

I have 64K ramcards in stock right now. $12.00 each, or 3 for $30.00.
Plus tax and shipping.
Each order comes with one new battery.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

6. XF551 - 127K doubled to 254K

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-02 14:35:16 UTC
From: Jack <tseng4@hotmail.com>
Message-ID: <EETBd.56472$up.12113@lakeread08>
Source record: 13461

Can I customize the formatted of 254K, 256 bytes X 26 sectors X 40 tracks instead of 127K, 128 x 26 x 40 in Atari XF551 disk drive? Do you think SpartaDOS 3.3 or MYDOS 4.5 can format 254K ? How?

Thanks!
Jack Tseng

> SpartaDOS 3.3 or MYDOS 4.5 can format 254K ? How?

Really foggy memory warning.

No. It may appear to format right with a modified ROM but the extra sectors ~19-26, will overwrite sectors ~1-8. It may appear to format right with the standard ROM but it would probably just go to 256 byte X 18 sectors or 180k for a single sided, 360k for double sided. The stock XF ROM is hard coded for densities vs. sectors per track. This may create a problem with some DOS in that they write what they think they told the drive to format to the disk.

I am kind of biased. I used to have a XF and even though I did modify it to 3.5"/720k I found the standard 5.25"/360k I got with Sparta DOS to be a huge amount of storage for any task I did short of running a BBS.

Well, it's strange because I can't seem to be able to connect to it. My 1030 dials the number and then as soon as it says "Connected!" it disconnects. Most of the time it doesn't even say "Connected!" at all, just times out. I can't hear the modem through my TV speaker so I assume the line might be busy. I was able to connect to the Sailor system Ed mentioned in his post with no problem. I wonder what I'm doing wrong...

Serge

True. Except that they were minis :-) (VAX 11-780s, 750s and 730s).
The Atari Coin-Op assembler was essentially a hacked PDP-11 assembler.

> That is one of the excuses why we don't have good source listings for
> various programs/OS anyway. Rumor is one of the first things the
> Tramiels did after the take over is sell off the mainframes w/o saving
> the programs.

Not true. I was one of the programmers that the Tramiels kept who was
responsible for transferring over a lot of the user accounts and source
code. (Writing video games one week, the next I was sysadminning a
bunch of Vaxen and working on the ST. Hoo ha).

The Tramiels lost quite a bit, but that's mostly because the state of
the software "library" at Atari was fragmented and incomplete.

Sounds like the data may possibly be intact and without a valid directory entry pointing toward it. Never found an automated utility, but patched many with DiskMend editor.

Could it be a bad cart? I have one and it works fine on my 800xl and 130XE.

Hi folks,

Today I have finished my website (it is never finished, but ok... it is finished for now).

http://home.planet.nl/~diepe534/ainside/

I'm working on to re-setup my BBS. It is in a Test-setup now, ... it might be connectable, but most of the time i'm working on it, so please be patient for the BBS.

Have fun on the site and I think the BBS part is nice to read.

Bye,
Marius

If you run OmniComm on your emulator,set for VT100,and dial:

1-410-494-1199

and follow the prompts (type 1 for Sailor program,and log in
as "guest")you can connect to the InterNet,using the Lynx (text-
only) browser.You can upload and download,using the Kermit protocol.

You must use an Atari terminal program that is capable of 80 columns,
VT100 emulation and Kermit transfers.

This has worked for me for several years now.
Websites that use frames are a problem.

I read your post,using my Atari,but had to switch to the PC
to answer,because the Lynx browser won't let me log in on
Google Groups to post replies.

BTW....I use:

http://groups.google.co.uk/groups?q=comp.sys.atari.8bit&hl=en&btnG=Goog
le+Search
to read the news group,as it uses the older,easier to read format.

26. WAV2CAS tips wanted!

Newsgroup: comp.sys.atari.8bit

Message-ID: <1104788851.068038.123430@f14g2000cwb.googlegroups.com>
Source record: 13481

I've got all these old tapes which I made using my Atari 800 but I no longer have the 410 Cassette player. I've found this great program but I'm not having a lot of luck. About 50% of my commercial tapes are working but only 2 of my own tapes have worked so far.

I've been tweaking record levels but so far it hasn't helped much. Seems a tape will work or it won't, mostly won't.

For those that don't know, WAV2CAS takes a WAV file, a recording of your Atari tape, and converts it to a cassette image usable by emulators like Atari800Win or usable on a real Atari by way of a SIO2PC cable. Both tools are PC based.

My question is, are there any tips for improving performance?

I should have used better tapes way back when but it's too late for that. Plus, much of my problem lies in the poor way I created the tapes. I used minimal labeling. I don't know which tapes are bootables and which are source programs. I don't know which are BASIC programs, nor how the programs were saved, CSAVE, SAVE "C:", or LIST "C:". I have multiple programs per tape. Some programs were indexed but I used tape counter marks which are useless to me now. This really makes troubleshooting the restorations difficult. LOL!

27. Video-80 Instructions?

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-03 22:11:01 UTC
From: stephensheppard@hotmail.com
Message-ID: <1104790261.868225.231550@f14g2000cwb.googlegroups.com>
Source record: 13482

I've got the BASIC creator program for Video-80 but I have no idea how to use Video-80 itself. I can run the creation program and produce either a bootable cassette or a disk file which should be saved as Autorun.sys. Both seem to load but neither seem to do anything. By the way I'm using Atari800win Plus 4.0 beta 3 emulator until my SIO2PC cable arrives. Maybe this is my problem.

I seem to recall that I should be able to output to a newly created V: device in 80-column mode or hook the driver into the E: device but I'm just not sure.

Is there something I need to do to initialize the driver after loading it?

I did my best to find instructions but the best I could do is identify the source. The program was published in Compute! magazine, Issue 36, May, 1983. I can't locate the text of the article.
Thanks in advance for any help.

I'm using it. Build-In with a CF-> IDE adapter with MyIDE. I have spartados
on it. It works perfect.
If 100.000 writes cycles is true, you would be amazed how fast you have
reached this amount in VTOC sectors.

ANY write or erase operation will affect VTOC. So if you have a partition
with a few thousand files the 100.000 is reached soon....

I have to say I haven't had any problems yet. But CF memory is not really
suitable for a live file system.

Thanks,
Marius

I am using SpartaDOS 16MB partitions with thousands of binary files (games
and demos) all loadable with one nice menu. This menu is called
'MicroSpartaDos' and is written by BEWESOFT. You can find the MyIDE version
of all this stuff on my homepage http://home.planet.nl/~diepe534/ainside/ in
'general atari info' and the subject 'Spartados and MyIDE' On the ATR image
you can find there the gamedos is also stored (with docs) I'm sure it works
with your IDE interface too.

Marius

p.s. it is a game loader for binary files. Binary files of almost any game
is available on the internet.

little sigh

Sorry for my *sigh* but did I ask for that?

Another answer could be: why not using the real thing? I H A V E and use the real thing, so I'm not interested in whatever emulator at all. But I want to test them all.

I have that PLUS version ALREADY and I want to know how to compile the atari800 1.3.5 to a working version. It is newer than the PLUS version so I want to try it out.

But because I'm a C-Dummy I don't know how it works, and the readme in the source package is just TOO small to let me understand it.

Sorry I sound a little unkind, and I am sure you wanted to be nice. So thanks for your contribution... I'm trying the compiling issue for years now so that's why I respond a little angry. But..... besides that I'm getting little tired of the off-topic answers some people give at questions in this newsgroup.

Thanks,
Marius

I believe you need Microsoft Visual Studio to compile it on Windows. I use an old copy of VS 6 and it works fine. You also need the Windows SDK installed and possibly the DirectX SDK.

After that I think you just open the project file and select 'make'. If its not working drop me an e-mail and I'll see how our configurations match up.

ANY write or erase operation will affect VTOC. So if you have a partition
with a few thousand files the 100.000 is reached soon.... <

Yes, exactly. A possible work-around is that the CF could be used as a number of different partitions, so use could be spread over a number of areas in the CF. But, I'm also still thinking of trying a Micro-Drive, which doesn't have the limited life issue. Probably still 2X or 3X the price of a CF unit, but the smaller drives are definitely coming down in price.

The recommended way (as mentioned in DOC/INSTALL) is:

1. Install and configure cygwin (which is a good idea anyway, cygwin
contains a lot of nice unix tools like make, vi, various shells,
gcc, gdb, ...). You need at least the base cygwin system plus
the development tools (gcc, make, binutils). Maybe also some other
packages, I haven't set up cygwin for quite some time.

2. Install the SDL library. This should be easier than using DirectX
for which you'll need the big DirectX SDK (some 150MB) from Microsoft.

3. If cygwin and SDL are set up properly, compiling atari800 should
be very simple:
./configure --target=sdl
make
make install

I haven't tested this yet, but some time ago (when I used Windows
more frequently) I compiled several unix programs using cygwin and
had almost no problems.

BTW: atari800 1.3.5 compiled fine under linux using gcc 2.95.

so long,

Hias

Indeed. I know someone who used CF for storing a cut down version of
Windows for an embedded device. Needless to say, it worked fine for a
couple of months then pffft.

38. Latest FAQ update - Atari history section

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-04 17:24:02 UTC
From: Michael Current <hunmanik@earthlink.net>
Message-ID: <15jlt0trce248214d6idcprmm2l2lecd3t@4ax.com>
Source record: 13493

Did your newsserver receive the latest version of the FAQ, posted about Dec. 26? I never saw it here, but I know it did post because it showed up at

http://www.cs.uu.nl/wais/html/na-dir/atari-8-bit/faq.html

Anyway, I was going to point it out because of the massive upgrade of the "Atari history" section at the end. I really put a lot of time and research into it, because I realized nothing of the sort had really ever been done before, and I decided my FAQ was the right vehicle for this collected information.

See Section 11.2.

(Don't bother going to faqs.org, that site still hasn't updated since last spring.)

Thanks for any feedback,

-Michael

39. Re: Unreadable MyDos Directory

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-04 18:17:01 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <41DADD9D.6FA2C89F@students.uni-mainz.de>
Source record: 13494

Well,
for a destroyed directory and/or VTOC TurboDOS has a file namend
"Diskfix" which does not only "scan" (delete/undelete/close/...) files,
it can also scan the whole disk. The option "recover directory" does
this and is able to find hidden files and repair destroyed or cleared
VTOCs and directories. Alas, I have not seen any similar program for
MyDOS yet.

The diskfix or Vtocfix program for MyDOS by Bob Puff cannot repair
destroyed or cleared VTOCs and Directories (like the turbodos Diskfix
program). it merely corrects available files and entries in the VTOC and
Directory. If there are no files or entries in the VTOC and/or Directory
you are almost lost with this program...

Maybe a good suggestion for a professional programmer to write such a
tool, that can a) correct/repair available files in the VTOC and/or
Directory, b) scan/repair/recover a whole disk/harddisk with a
(partially or completely) destroyed VTOC and/or Directory and in
correspondence to MyDOS work with every MyDOS density (90k up to 16MB)
and with Subdirs too...

But a programmer would not only need a good knowledge of general disk,
directory and VTOC organisation, but also a good knowledge of MyDOS
directory(ies), subdirectory(ies), format(s)/density(ies) and VTOC(s).
Not an easy task...

Anyway, with the help of the TurboDOS "diskfix" program and its option
"recover directory" I could repair lots of damaged diretories and VTOCs
and furthermore find a lot of hidden programs (ML-files that were
hidden, so the disk seemed to be a bootdisk), even on commercial
disks... -Andreas.

P.S.: Thats one of the reasons why I do not use MyDOS quite often: there
is no program to "undelete" files (deleted by mistake) and no program to
repair or recover lost directories or VTOCs, etc. Meaning, if something
goes wrong on a MyDOS disk (or harddisk) your chances of repairing it
are almost nil/zero...

40. Re: Compact Flash Hard Drive?

Newsgroup: comp.sys.atari.8bit

Source record: 13495

Well,
the MyIDE supports CF cards quite well. Alas, they will not last many years - as you may think. Whenever you "call" a CF/SD/MD/... card or USB-stick or something similar, it does 4 read/write attempts. So you have to divide 100,000 by four !!! ABBUC PD librarian Walter Lojek spend almost a year at military service in Afghanistan - and he had a digital camera with some flash card there. He used his camera almost every day and in less than 3 months the flash card was no longer able to save something permanently...

So, for an atarian that almost never uses his computer system and data, the flash cards (and other similar media) might be a fast and good solution to save program data on. But for all those who use their Atari quite often, it would be an awful solution - or would you like to lose your Atari programs in less than a year ?!? Or to backup (many megabytes) every 3-6 months ?!? -Andreas.

41. Re: Menus, multiboot, image managers ... ?

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-04 19:22:46 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <41DAED06.1B4689EE@students.uni-mainz.de>
Source record: 13496

Well,
first to the last question. Every harddisk takes some time to reach its operating speed. Believe it or not, the Atari is faster than that (time of the HD to reach Op. speed). And thats why it displays the Selftest first and boots fine at the second try. Alternatively you can power up your Atari and hold down the Reset key for 5-10 seconds, when you release it, the HD should boot fine and no selftest appears...

Speaking of menus... at first Atari created a thing called DOS to talk to the disk drives. Alas, DOS uses up quite some memory and has many functions and options not required by gamers. So clever programmers wrote a shorter "disk boot thing" that merely loaded files (mostly ML files) and therefore required less memory. These programs are known under several names, e.g. Micro-DOS, Short-DOS, Game-DOS, etc. Most of these gamedos versions present a menu, where one can choose which file to load (to create such a menu, one has to load the gamedos init program from a DOS or an already initialized gamedos disk), thus allowing many files/programs per disk...

Next there are bootloaders, for many people they are the same as the already mentioned gamedos programs. But afaik, bootloaders were originally written to just boot the disk and/or load *one* program (mostly the first or the only program on the disk). So there was no need to press any key in a menu, no big waste of disk space, etc. and still the possibility to boot a disk program...

Multiboot (Alphaload, Howfendos, Rob C. Menu, etc.) are examples of british multi-boot menus. They act like a gamedos, presenting a menu with files. Alas, most of these menus are not DOS 2 compatible and use their very own file structure. As you may know, the brits loved tapes (for whatever reason) and since there were hundreds of Atari programs available on tape in UK/GB, these british menus allow one to copy/convert a tape to disk easily. Early menus allowed only single-stage tapes, later menus could also copy and then load multi-stage tapes off of the disk...

Image managers are (afaik) programs to "act" or manage disk / harddisk images. Originally the Ataris had only diskettes (and cassettes/tapes). Later harddrives and thus harddisk partitions became available. Even later there were some things called emulators, which could emulate an Atari floppy disk (or harddisk) or a complete Atari system (computer+floppy+...). The software for these emulators was no longer stored on real 5,25" diskettes (like on the A8), instead one uses so-called images of real atari disks. Thus image managers are programs which are able to load and/or save and/or sort and/or manage a big

amount of various images in some way...

Now, originally atari harddisks did only allow disk-files (or program-files), but no boot-diskettes. So having a harddisk and many commercial disks could have been frustrating. one could copy all the program files to harddisk, but not the bootdisks... Well, for the emulators and their atari images, it does not matter, if the virtual disk (the image) contains any files or a boot-disk. The MyIDE by Mr. Atari (Sijmen Schouten) also allows to store both program files (that can be loaded via DOS, Gamedos, Bootloader, etc.) and bootdisks (as images) on a connected harddrive. And since the MyIDE has no limitation concerning the number of images on a harddrive (the only limit is the harddisk size!) but alas a limitation concerning the names of these images (four or more numbers!), the MyIDE image manager was born... It can load or save any image from/to the MyIDE harddisk and furthermore it allows one to use proper (8.3 I guess) filenames instead of numbers...

Enough said. Simply e-mail me, if you need some sample disks (with DOS, Gamedos, Bootloader, Multiboot, etc.) and I will send you some zipped ATR images... -Andreas.

Well,
allthough I do not know what this should be good for - it can be done easily under sparta or MyDOs. Just format the disk with the following options:

a) Sparta: 40 tracks, double sided, 1050 (enhanced) density; use Xinit.COM or a similar program;

b) MyDOS: first use option "P" and set your drive to single density (for drive one you have to respond with P then 1,S). Next choose option "O", give in the drive number (1-8), remove drive? N; is drive config.? Y; high density drive ? N;
double sided? Y; tracks? 40; step rate? 0 (zero) or 3 (depending on the drive). Finally use option "I" to format the disk. Input the drive number (1-8) and when the option "Y"es to format disk, "A" to format atari enhanced appears press A. You now have a double-sided ED disk...

Allthough MyDOS and Sparta can produce and even read/write/boot such a double-sided ED disk, it is a non-standard density. No sector copier (available today) will copy this disk... Last not least one could also produce ED with 80 tracks (single and double sided), but as mentioned earlier - what for ?!? -andreas.

polish disk drive - TOMS 720 - could format odd tracks separately from
even tracks creating two 'virtual' sides of any density per disk side.

46. Need help with XEGS upgrade!

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-04 21:04:45 UTC
From: dunxuk@aol.commercial
Message-ID: <20050104160445.12288.00002953@mb-m28.aol.com>
Source record: 13400

I have just installed a Granlin stereoplus upgrade into a PAL XEGS after its original Pokey started showing problems decoding paddle positions. Good news is the paddles are working now and normal sound works, bad news is the extra channel remains silent.

The manual suggested some peeks including $D209 and $D219 and the second Pokey appears to be there but stays mute. The board outputs audio to phono jacks and also straight onto the mainboard near the modulator but there is no sound apart from normal mono from the phonos, the audio-out and the modulated out.

Are there any reasons why this upgrade won't work with an XEGS? The manual only shows installation on an 800XL and a 130XE; is the XEGS sufficiently different to cause problems? Anything else I can check to see if it is operating?

Thanks in advance,

Dunx

Actually, it allows you to name your images with a 30 character
description. Version 2.0, which I am going to release soon (as soon as I
add some documentation) also allows you to assign a category to your images
as well, so you can view only games, or only utils, or demos, or whatever
you want.

Version 2.0 also fixes a nasty bug that probably caused most disks you
tried to boot via the MyIDE Image Manager not to work. I'll post a message
here when I release it.

Hi!

Just want to know if anybody has pointers to where to look for info on USB Pendrives. It would rock to get that to work with the Atari, even if it only is 16Mb that can be used. I would sure like to be able to access that and use it as a storage for all my files on the 8-bit!

Take Atarian care

54. Do I have a genuine Atari 400/800 OS rev A ROM set?

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-05 21:13:51 UTC
From: stephensheppard@hotmail.com
Message-ID: <1104959631.328890.269640@z14g2000cwz.googlegroups.com>
Source record: 13408

Can anyone confirm whether or not I have a complete Rev A ROM set?

I was looking for the original covers for my Atari 800's memory boards and OS ROM board. Packed with these parts I found a ROM labeled C012499A, R3280-11, 8040.

I looked at my OS ROM board and the part installed in socket A403 is marked C012499B (which I assume replaced the C012499A). The other two ROMS are labeled C014599B-01 (socket A401) and C12399B (socket A402). The PCB has the part number C012989 REV D, dated 1979.

I don't recall upgrading my OS but I can't imagine why I would have the older chip for any other reason. I'm the original owner of the 800 so no one else could have upgraded it. It's an NTSC version (USA) purchased around 1981.

>Steve Sheppard
Hi Steve. It has been a while since I tweaked the wav2cas program.
I suppose there is still room to improve the recognition of bytes. If
you look at the .hex file you can see if the records can be recognized
at all. If all records show "OK" you know the conversion process
worked, and then it is a matter of knowing what the type of file is.
If you see a lot of "BAD" records, you may want to play a bit with
the recording level. If that does not help, you could tweak the
source code a bit, if you know 'C' and have a compiler.
I wish I had some time to improve the algorithms a bit.
I have been tweaking a bit to get high baud rate tapes to convert.
But that version is not ready for release, and currently I have no
time to work on it either. I can mail you the current betha version
of this to see if this improves recogniztion.
Tape quality does not really matter, as long as there are not to many
drop outs on the tape. The type of tape file can sometimes be
determined if you look at the .hex file. After the tape header bytes,
the first data bytes in a basic save file are 00 00 00 01.

The difference between CSAVE and SAVE "C:" is only in the
length of the gaps between records, not the contents, so that
should not make a difference. If you did a LIST "C:", then the
basic statement should be sort of readable as atascii letters,
although the PC will not always recognize them as text.
All other stuff is probably a bootable cassette.
Multiple files on one tape should not be a problem.
Since you are obviously using an audio cassette deck,
simply listen to the noise, and the pieces of silence in between.
It should not be that hard to figure out where the next file
starts. The wav2cas program will find the start of the file
better than the Atari, which is picky about timing when starting
to read a tape file.
Feel free to mail me your questions.
Others that have had experiences good or bad are welcome
to post their experiences here of course.
I also have a cas to atr/bin/bas etc conversion program
called cas2atr which I wrote. It is not that hard, but I have
not finished it up. I have no time to write the documentation.
Therefore I have not released it yet on my web page.
Anyone that wants it is free to mail me for it.
If the files are converted to .bas for instance, then they can
be put into an atr image which is easier to manage in the
emulators. Use tools like dir2atr for this then.
Hope this helps a bit.
Keep those XL's/XE's buzzing.
Ernest.

58. NEW ATARI 8bit WEBSITE ONLINE

Hi Ernest,

Thanks for replying and thanks for the beta version. I'll be checking
it out shortly.

Good tips. Pre-examining the hex files for file type sure beats trial
and error. LOL!
I'll give your other utilities a try as well.

Steve Sheppard

Hey I have a UDS 10 and I have the latest version of Pro! I wasn't able to get it to answer over TCP/IP using his custom waitcall.cmd file and Steve Carden was helping me then we kind of lost touch. I'd like to finish that project.

62. UDS10 -v- MSS1-T

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-06 07:02:54 UTC
From: jamesk@ATxmissionDOT.com
Message-ID: <crinqujgr1@news.xmission.com>
Source record: 13416

Instead of a Lantronix UDS10 (serial to Ethernet adapter), I got a
Lantronix MSS1-T.

Anybody know what the real differences are (except that the MSS1 is
discontinued)?

In addition, what's the trick to get the device to drop carrier when using
it for inbound access to my BBS? Currently, when I logoff from the BBS via
an inbound telnet, it will show the AT commands in my telnet session,
rather than dropping the session.

Any responses appreciated.

What do you mean with 'inbound connection'?

The first VERY important thing is you have the RIGHT cable for the MSS serie. It has been a VERY long time since I have used the MSS for the BBS. But, and i'm sorry for the guys who bought and UDS-10, I have the feeling I was more happy with the MSS serie... so keep the faith and first try to get a real cable.

You can find the right info on building on on http://fox-1.nl

Thanks for all your kind words.

First important thing for people: PLEASE beware the BBS is not up officially yet. It is up, but for testing only at this moment. Sometimes it is down when i'm doing other things on the atari (like testing the UDS-10 for Doc Clu wehehehe) ... when it is 100% up you all will know.

Thanks
Marius

Hi,

the microusb team (at this time 5 persons, homepage at
http://www.microusb.org/) is working on this. We need as much help as
possible, so if you like to join your are very welcome. USB Flash drives
are full speed devices (USB 1.1) using BULK ONLY Transfer, which is a kind
of SCSI over USB. The description is in the USB 1.1 Specs at
http://www.usb.org

We also have collected a lot of other information from various sources
that we can send you. Also the Linux driver for the SL811HS Controller we
are using in the USB Cart are a good source of information.

We will have a usb coders weekend next on 15th-16th january where we want
to finish the full speed code for the USB Cart (we currently only can
speak low speed with the Cart).

All sources so far are published on Sourceforge, http://microusb.sf.net.

Best reards

Carsten Strotmann

Marius - I'm confused. When I asked about this before, (I believe it
was comp.sys.atari.st) you recommended that I get the UDS-10. So I did.

Did I miss something?

Thanks.

> Marius - I'm confused. When I asked about this before, (I believe it
> was comp.sys.atari.st) you recommended that I get the UDS-10. So I did.

I feel your point. Actually it is simple.

Both devices are good.

Both devices do have good and bad parts.

A good part of the UDS is that it is almost plug and play. You don't need special cables and it behaves very simple in a terminal.

A bad part of the UDS it doesn't have DNS support. That means you can not type in ATDT<host-name> but you have to type ATDT<IPNUMBER>.
With the MSS you are able to type in ATDT<HOSTNAME>

The good part of the MSS is that it has a better 'busy' handling (this is only interesting when you want to run your own bbs), and what i like at the mss is: it has two telnet ports open: one REAL telnet protocol (8888) and a RAW telnet port (8889).

So it is hard to say. I could remember it is very hard to get this mss working, especially with that special cable i had to make, so my advice was: UDS-10.

And there is another part of the story, i didn't knew at the time i wrote that message:

DrClu received his UDS10 yesterday. We have had lots of trouble setting it up at his place. and we found it is not very handy the UDS-10 doesn't support any DNS handling. Bootfactory BBS's ip number changes every 10 minutes. So how to find out the IP of it... there you go: you need another computer to find out the current IP number.

Sorry for the inconvenience.
Marius

p.s. I am NOT related in any way to lantronix.

This is the first I've seen about the UDS-10 interface, and it looks pretty
cool. What do you have to run on the Atari, software-wise, in order to use
the unit?

I'm assuming I would hook it up via an 850 and configure it remotely from a
PC...

Also, where's the best place to get ahold of one of these?

Thank you! I would love to try to help out. If possible, please do send me the sources, that would be very helpful. You are coding assembler, right? I'll check out the pages too and download all I can from there! Good luck with the project, hope to be able to supply something myself later.

Take Atarian care

Why would I need a special cable? Right now, I'm telneting out of my 8bit
via the MMS1-t using my existing Ribbon cable to BlackBox w/DB25 on one
end, and a null modem adapter (from radio shack) on the other, connected
to the MSS1-T? Its working just fine. I also had a couple good instances
of inbound telnet to my BBS and got both ATASCII and ANSI screens.

> A bad part of the UDS it doesn't have DNS support. That means you can not
> type in ATDT<host-name> but you have to type ATDT<IPNUMBER>.
> With the MSS you are able to type in ATDT<HOSTNAME>

With the MSS1-t, you just type TELNET domainname.com, there's no ATDT
required unless I do a CHANGE MODEM EMULATION ENABLE.

> The good part of the MSS is that it has a better 'busy' handling (this is
> only interesting when you want to run your own bbs), and what i like at the

That's what I'm still trying to figure out. The MSS doesnt ever come back
with a busy, and seems to ignore the DTR state of my BBS's waitcall.cmd.
I'd like it to 'hang-up' after a disconnect from the BBS, but currently it
just shows the AT commands in the remote telnet window.

Also, the MSS uses standard telnet (TCP port 23) for management and ports
2001, 3001 (for emulation) and 9001 for SPX (Netware) support.

You need nothing but a cable. I configured mine directly from my 8bit
Atari via the Serial interface. You can do it from a PC if you like, but
you have to precofigure and IP address first.

> Also, where's the best place to get ahold of one of these?

I got my MSS1-T on eBay for $40 US.

Thanks. I'm still unsure what software you're using on the Atari to allow
the TELNET command you mentioned in your other post.

Nevermind - It's been a while since I used serial communications, so I had
to think. The hardware interprets the commands - no the software. :)

Hi,

all sources are on the microusb website and also on SourceForge. There are also two tutorials on how to write an USB HID Driver and how to patch a game to use with an USB Controller.

I code first in Forth (X-FORTH) and then port the driver to Assembler. Almost all sources on the websites are in assembler. If you don't like Forth or Assembler you can also use ACTION!, CC65 or Quick or even Kyan Pascal. Only Basic might be too slow.

It would be nice to have you on board with the team.

Best regards

Carsten

That's exactly the point. A standard null modem cable WON'T do the job.

See the manual! (you can download manual on www.lantronix.com)

You have to connect 2 pins of the nullmodem cable together.

Thanks,
Marius

It's so great to hear things like these almost eight years since the last release. Thank you :)

I've considered fixing up the sources so they'd compile on a modern machine, comment them, and *maybe* :) release them. I haven't had very much success so far, but would a project like this actually interest anyone? Not that I'm promising anything, this would be a huge effort.

The most annoying thing is that I can't get the damn thing to run on an emulator so I can show it off to friends at work. Grr.

(I've done such a restoration to my Tetris clone "The Wall" successfully.. Took me several days to understand what the hell I did and comment the damn thing, and it's a 4k game! the nice thing is that it assembles with ATasm, on Windows XP, to an identical executable to the original release. kewl.)

I actually have an original copy of them game (no I did not buy it,
someone gave it to me, I can't even remember who). I played it on the
real machine. The game is copy protected, IIRC Steve Tucker converted it
to a .PRO image (that's a disk image that retains the copy protection,
used with APE and an Sio2PC cable) for me (I sent him the disk) but this
format is not compatible with any emulator that I know of.

If you want the .PRO image, which contains my saved game which is past
the helicopter sequence, I can send it to you but you will need a real
machine and APE to use it.

email me if you want it. (change 0 to o)

I wonder what would happen if you sent: AT&D2&C1
IIRC, That's how you would get the Hayes compatible modems to hangup using
the DTR line.

Hmm, I don't think cartridges are a great idea because they are relatively
huge.

Also, I don't want to use up loads of FPGA pins to access it.

Limited pins are probably the reason my laptop has SD/MMC slots but not CF
slot.

I recently added a USB slave port so my project can be loaded from my PC
instead.

This also means it is not confined to any manufacturer-specific cartridge
slots either! :-)

Joysticks and paddles I can certainly do.

How would you like the Atari keys mapped onto the PS/2 keys?
F1 to F4 are easy, but what about the rest?

I'm thinking it might be a bad computer. Never used a cartridge with
this 130XE and it's been 15+ years. Otherwise the computer is fine.
The Ebay seller has no negative feedback so I've little reason to
think I was ripped off deliberately. Unfortunately I just can't test
it on another Atari right now...

Hey Thomas! Well, its BBS Express! ST. Using a Mega ST. Yeah, I know, I'm in the 8bit group, but I had originally posted this question (which Marius was kind enough to reply to) in comp.sys.atari.st.

Anyways, I guess the concept for getting it going should be the same. It would probably help if everyone shared experiences with this. I know it would help me. Heck, my BBS has been down since about '99 or so. :-)

I'd certainly be interested in seeing the source if you ever release
it. No probs if you can't though - it's tough to go back through old
code and figure out what you were doing.

Wow, are there ever some impressive message traffic going on... people getting UDS-10's for setting up BBS's, and others wanting to get MSS-1s for getting on those BBS's. At this time there are three KNOWN Atari BBS's out there, and more on the horizon. In truth, I have not felt this kind of fun since the days I had my 1030 modem running.

Slor,

You are excited, I am excited to have another person connecting up his Atari computer to the network! Be good to see you on the BBS's.

Ron,

I look forward to seeing Dark Forces up again. You were a good sysop, and in truth, the idea of door prizes and awards for BBS activity were the inspiration for wht I am going to try this year. Man when you came back you jumped in with both feet. :)

In general...

These devices, like the UDS-10, is a wonderful addition to the Atari. Here in Dallas we have dialup BBS's, and most of those have telnet connections. Since I don't want to tie up the dialup line, I have telnetted in.. so there you go! With this device, HUNDREDS of BBS's are within range of the Atari so long as you have a internet network that the UDS-10 can connect to at home.

Even more fun, three Atari BBS's are now in range, where you can see ATASCII graphics yet again.

Cool thing about the UDS... to set it up you bring up Bobterm or some terminal program, set it for 9600, and as you are powering it up hold down X. I will probably write a more detailed account of this for the A-One text newsletter soon.

To "dial", since the UDS emulates a modem, all you have to do is type...

ATDTxxx.xxx.xxx.xxx

ATDT and the IP address, and you go right there, like I did to this BBS that I am writing this on. And there is another cool thing... check the Atari newsgroup messages on a BBS with your Atari. Check E-mail from a telnet shell account (like the Family-Net or Grex.org), or send files to a E-mail account on a BBS and download them, or send them to someone else. If you wanted to, you might go for hours getting things done on the Atari 8-bit without needing to power up the current machine. In my case, if it were not for instant messaging, I'd probably never power up my Mac. :)

Browsing... well, telnet to Grex.org and other BBS's with a Lynx browser,
and there you can browse out to internet sites (all text, but hey it's
something).

But the most fun, jumping on the Atari and letting it take you places yet
again. ;) Now that is awesome.

Any questions on current BBS's, and getting around on a Atari, feel free to
ask.

Suite!!! I tell you, get a 850 interface and a 19.2K modem for $1, and
you'll be surprised how that Atari 8 can fly. :)

Where are you telnetting from?

Any rate, try these Atari BBS's....

cth.dtdns.net
bfbbs.no-ip.com

And a few others are in the works. Start with those for now. ;)

Get on, hit the message bases... post something! :D

Sorry about that, Jess. Turns out it was Compute!, April 1983.

Someone sent me a copy of the article. I was missing the initiating code for Video-80. Unfortunately, even with this I am still not able to get it working under Atari800Win Plus.

Guess I'll have to wait until I get the SIO2PC cable or retype the program (which I don't want to do) so that I can run it on the real 800.

Well i've been reading all these posts about UDS 10 and everything and I want some advice. I used to run Pro! on a 130XE with 576k RAM upgrade and MIO 256k with 20MB hard drive. I still have all that equipment. In addition, I now have a UDS 10, a 800xl with Wizztronics 256k ram upgrade AND Steve Tucker's 32 in 1 (or however many it has) OS upgrade chip which INCLUDES MyIDE OS. I also have a MyIDE interface cartridge WITH the OS chip (I traded Mr. Atari so he built me one), an additional 20 MB hard drive, and a plethora of extra hardware (800xl's, 130xe's, xf551's, 1050's), 850 Interface, a spare laptop, a APE cable, a SIO2PC cable. Surely I can have a pretty neat setup with all this stuff, I just don't know what to put all together. I did some beta testing for Steve Carden so he upgraded my node to the latest Pro! so that is all current. I would love to get this thing online and am confident I have what it needs. TIA for any help!

Thomas

BTW my BBS was called The Electric Cafe' Node 363

102. Logitech Forula GP Wheel USB Driver released

Source record: 13306

Hi,

the MicroUSB Team is announcing the new Logitech Formula GP Wheel Driver.

see
https://sourceforge.net/project/showfiles.php?group_id=111428&package_id=134212
and
http://www.strotmann.de/twiki/bin/view/Microusb/ProjUSBCartAtariLogWheel

A Disk Image with VBI Drivers and the compatibility test Program
HARDTEST.COM is available.

A patched Game (possibly Ralley Speedway) will be released soon.

This driver is based on the new Modular HID USB Driver.

Best regards

Carsten Strotmann

105. atari inside BBS test setup online

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-09 01:50:28 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <crq39ullj1@reader08.wxs.nl>
Source record: 13310

Hi folks,

You are all invited to test bbs Atari Inside.

There is not much to do yet.

It is a test setup.

I would like if you test it.

Only one person can be on it at one time, so if you can't get a connection
it is probably 'busy'

This is running on real atari 8bit equipment.

All people who had alread an account (sorry AtariFrog)... you have to
register again, all accounts are lost in space.

telnet://213.10.217.144:8888

If it keeps failing (to connect) please report this to grover25 AT zonnet
DOT nl

Thanks
Sysop*Marius

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

Docrotcod,
|
That is sounding like a awesome setup so far. To matter the fact you have all the elements to go BBS'ing, and to set up a BBS. All that stuff you have.. the 130XE with the ram upgrade, the UDS-10, the APE interface and laptop.. etc etc down to the 850 interface is what comprises the Atari Inside BBS. My advice, check out the Atari Inside BBS at..
|
213.10.217.144:8888
|
And naturally log on with your Atari computer and UDS-10. :) |
If you don't have that working, the ATS program on the PC is just fine to get the gist of it, and then work up to the real equipment. Good luck, and maybe talk more in the chat I'm going to mention in my next message.

108. Atari Chat 10 am CST Sun

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-09 09:57:08 UTC
From: Greg.Goodwin@family-news.org
Message-ID: <239059.291f24@fmlynet.org>
Source record: 13314

```
Hey folks!
|
Well, you are all invited to stop by the chat room that is very Atari friendly,
the chat room at www.atarinews.org (or for those of you with the DNS challenged
UDS-10's, usually at 216.200.173.22) |
To get to the chat room, at the first two prompts, enter "bbs", then when it
asks for the login name the second time enter your login name and password. If
you don't have one, registration is only like a two minute process.
|
Once in, at the first selection hit T for Talk, and then C for Chat. |
After that, enter some spiffy chat name, and you're in! |
Pretty cool really. Hope to see some of you there, and if possible, on
Atari's. :D

Still a problem for me. After the first "Hit Enter" prompt when I get to
the select terminla emulation (1 - ATASCII or 2 - COlor), the bbs
automatically enters a 2 before I can type 1 so I cannot get in.

I would say probably the same way they are mapped on the emulators. Although,
when I do use an emulator I still find myself pressing shift-2 for the
double quotes...

Message-ID: <pan.2005.01.09.17.47.38.489458@strotmann.de>
Source record: 13320

Hi,

the game Robotron 2048 can be played with two Joysticks (Joystick 0 - move, Joystick 1 - Fire Direction).

There is now a patched version that works with an Logitech Rumblepad USB and the USB Cart. With this Controller playing Robotron is even more fun. Check out the Disk Image at http://www.atariage.com/forums/viewtopic.php?p=774410#774410

Best regards

Carsten

Abdul,
.
The problem of Atari Inside giving the 2 at the beginning happens to me too. But remember, the BBS is a experimental BBS afteral and Marius is fevorously working to get the bugs out (which you might be able to help with running the BBS that you do.) I've noticed so far three different varients to the pro BBS it seems.
.
Me, I get on, and carefully try to hit enter and 1, and sometimes that works, and sometimes not. When it hits 2 for me, I drop back to ascii, and then when at the main menu, select terminal type and then Atascii. .
I routing for you.. we're all in this together. .

How do I telnet from an Atari? Do I use the R: emulation on APE? If so,
what client program do I use to move around once I telnet into a BBS?
BTW the reason I'm using the 1030 is because I want the whole "dial-in"
experience. :) I was able to connect to the Maryland Sailor system
using the above setup and it worked fine.I might get the 850 at a later
date, need to ask my friend if he has one.

How to telnet...
.
You mentioned dialing into the Maryland Sailor system. Ask on that system if they have a telnet feature. Small chance they do, but if they do, awesome. While on the Maryland Sailor you can telnet out (letting them take care of the telnetting for you in other words) and telnetting through them hit the other telnet sites out there, amoung which our few Atari BBS's.
.
Of course with a laptop with win 95 or higher, a SIO2PC cable, and it connected to your internet network you can hit the internet with your Atari without a 850 interface.
.
Or with the 850 interface and the lantronix UDS-10 you can dial out over telnet without another computer's aid. Granted you have some nifty gadgets and devices doing things for the Atari, but since when did the Atari not have nifty gadgets. ;) .
Ok, you will probably have more questions, but see if that BBS you dial into has telnet.
.

Nice to hear you are happy.

When the Test Period is over, I will add more messagebases, online files for
download and more nice online games. I will update the info files and made
the menu-structure a little better. Lots of work to do, but now I want to do
it the right way, so first a good test period.

Thanks!
Marius

137. atari BBS newbie manual

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-11 01:31:30 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <crvai0$24d$1@reader10.wxs.nl>
Source record: 13342

Hi Folks.

For those people who want to connect to the atari BBS but really don't know how things work. I'm working on some kind of online manual. It is a first try, and I have to make that thing really much better, but for those who can't wait... give the manual a try:

http://home.planet.nl/~diepe534/ainside/bbsmanual.htm

this manual is part of my site:
http://home.planet.nl/~diepe534/ainside/

and belongs to my bbs (still in TEST setup)

telnet://213.10.217.144/8888

Sorry for the many postings about this subject at this moment. I hope to be permanent (no TEST setting) online soon, and then I won't post as much about this subject here anymore.

I try to make this 'service' cool and nice. That is necessary. Last year I was online and the project failed terrible. I had too old equipment, and i realised I had a non-stable setting to work with. Due to no users and big troubles on the system I had to take the board down.

So please take a look and let me know all the things you like to see on this board (like more games, messagebases etc) so I can see what I can make of it.

Thanks for your attention.
Marius

146. ramdisk/harddisk drivers

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-11 03:34:05 UTC
From: damage_x@hotmail.com
Message-ID: <1105414445.453797.92180@f14g2000cwb.googlegroups.com>
Source record: 13251

I only have 64K of RAM so haven't experienced a RAM disk on Atari but I think that most of the drivers intercepted calls from DOS which allowed for fast data rates. Other drivers (like the M: memory file device which came with DOS-XL and MAC65) seem to have a 7KB/sec bottleneck because of CIO or something.

I built the MyIDE interface and have been playing around with the provided OS patch. Accessing the harddisk that way is on the slow side at around 6KB/sec. Writing straight to the drive with an assembly language program gets a much improved 17KB/sec (don't know what the limitting factor is there, I would expect more than that given the tight loop that copies between the IDE port and RAM)

I used to have the source for a ramdisk driver which ran under spartados (can't find it now though). I want to rewrite one to access the harddisk instead of extended RAM so I can have fast harddisk access with spartados 3.3 (or maybe some other DOS with command line that supports large partitions?). But I'm not sure how the whole user->CIO->DOS->? calling works.

I see the video player at mr-atari.com reads directly from the disk rather than going through (D)OS. It would be nice to have that kind of speed all the time...

>use MYIDE via parallel bus???? Can XEGS use MYIDE via SIO ???

There's a ECI version of MyIDE? Perhaps you are just confused since the ECI and the cartridge slot are used together to form the parallel bus on the 65/130XE...

The MyIDE device (at least the one release at http://www.mr-atari.com/ is a cartridge slot device, which means it doesn't work via the PBI or the SIO port.

There is a IDE hard drive interface called SIO2IDE that works via the SIO port, and one that works via the PBI port (can't remember the name, but it has been talked about and offered for sale here in csa8 recently.

I don't know exactly how a ramdisk driver works, but I'm assuming it does the same thing as other SIO patches, like the MyIDE drivers or a high speed SIO patch. They usually hook the SIO vector, running their own routine when any sector IO is called for on the disk. In the case of the MyIDE drivers they check whether the device is a partition on the hard drive or a physical disk passing control onto the corresponding routine.

>I built the MyIDE interface and have been playing around with the

I think that any speed issues have more to do with the normal SIO overhead, error checking and the fact that there must be calculations done to convert the floppy sector into cylinder, head, sector of the hard drive. Since not all hard drives are the same, these values can be pretty much anything-we can't make any assumptions.

The video player is optimized for the specific task of streaming data off the hard drive... much easier to make fast.

In my Image Manager program for MyIDE, I have to do something like the following to figure out how to map the sector to the C/H/S:

```
c = cyl + ((sector / myide_config.sectors) / myide_config.heads);
s = (sector % (myide_config.sectors));
if (s == 0) {
s = myide_config.sectors;
--c;
}
h = t % myide_config.heads;
```

There may be a better way to do this (let me know!), but you get the idea...

I'm sorry but starting bid $999.95? Get real. The thing isn't complete to justify such a starting bid. If it had the cover, power supply, manual, and a full collection of cards then I would say it justifies the high starting bid.

I think the highest that a 1090XL, in that exact same condition ever sold on Ebay in recent years was $500. I'll be surprised if anyone makes a bid.

Strange... I had to reset my UDS10 this morning.
I hope it works again now.

Btw. in bobterm you really need to type: ATDT213.10.217.144/8888

That is the only way with an atari 8bit terminal in combination with a UDS10
to connect.

In my opinion Bobterm (1.23) is in 40 column width absolutely the most
perfect program.

If you have 128KB (or more) and you want to login with 80 column width
(without any hardware adds like xep80) and use a real VT-102/ANSI terminal
ICE-T is your choice. That is really fantastic, it even support z-modem
downloaden.

Greetz,
Marius

I'm lurking, Marius.

As you might remember, I don't have Atari hardware anymore and I've
been using emulation. I just set up a new PC and I'm slowly getting
it into shape. Atari is kind of low on my list of priorities at this
time, but I will be back on the BBS scene eventually. Right now,
there are some minor family emergencies that have me a little
preoccupied and some projects for organizations that are also taking
up time.

Maybe in a few weeks, you'll hear from me via the BBS.

Take care, and thanks for asking.

Alan

That sounds right, but if the MyIDE drivers work the same way then I
guess the slowdown isn't here afterall. Do you know offhand where that
SIO vector is?

In your example I can only suggest storing the result of
myide_config.sectors * myide_config.heads so that you can avoid one
division in the calculation for c.

I will experiment with this a bit more but maybe I will just buy a
MyIDE OS ROM.

Cool - I didn't want to do the dual monitor thing with my XEP80 and
BobTerm, so perhaps I'll give ICE-T a run to see how it performs.

I was happy to find yesterday that BobTerm supports the P:R: connection out
of the box. The fewer things I need power outlets for the better!

Can anyone tell me how to rescan the SIO chain for a drive change in SpartaDOS?

Since I probably don't know what I'm really asking, let me clarify... I would like to boot to SpartaDOS (32g) using an ATR image and an APE cable/software. After booting the computer I'd like to deactivate the virtual APE drive #1, turn on my XF551, set as drive #1, and use the XF551 as drive #1 thereafter. MyDOS allows me to do this, but I can't figure out how to do it in SpartaDOS. Is there a way? (I want to make sure I can switch from SS/SD on the virtual drive to DS/DD on the XF551 during this process as well.)

When I try to just do this without some kind of an initialization routine the computer doesn't recognize the XF551 as valid. I've gone through many SpartaDOS utility disks and haven't been able to come up with anything so far. Perhaps I'm missing something really basic, but I'm new to SpartaDOS... I recently ordered a SpartaDOS X cartridge with documentation, so that may help when it gets here.

What happens if you unload the image from APE, unplug the APE cable from the computer and plug it into the xf551, and plug a SIO cable from computer to xf551? I would think this would work.
There's nothing in the computer that 'stores' your drive configuration. The only problem I see with this is you are hot plugging the SIO, which I guess isn't a good idea.
You say it works with MyDOS, what steps do you take to do that? Have the xf551 turned off when you plug/unplug, that may help.
It is generally a good idea for both the computer and disk drive to be off when plugging/unplugging the SIO. How about just copying the .ATR to a real disk and booting from it with the xf551?
There is a location that stores the number of drives in the computer, that works with DOS 2/2.5, ie. if it stores 2 drives, you can't access a 3rd or higher drive with that DOS. SpartaDOS doesn't do this.

I'm not a SpartaDos expert (actually, I've used SpartaDos only a very
few times to do some tests), but IMO the problem could be the highspeed
SIO routine:

The first time a drive is used, the routine 'asks' the drive about its
SIO speed (SIO command $3F). If it is highspeed capable, this speed is
stored and used for subsequent transfers.

If you now unplug the drive and plug in a different drive that doesn't
support this speed, the transfers fail.

The same happens eg. with TurboDos (or even with MyPicoDos) when
you boot from APE/SIO2PC/AtariSIO/... and then plug in a real
floppy drive. Even ultraspeed-capable drives (like Happy, Speedy,
AtariSIO/APE/...) use slightly different speeds and are therefore
incompatible.

So, I guees, you'll need to reset the highspeed SIO routine. But
I don't know how to do this with SpartaDos...

so long,

Hias

If THAT is the problem he could test with spartados 3.3a ... that has no
highspeed routine.

And besides that... it might be a density problem. The XF551 is really a bad
density switcher. I don't know if that is also a problem when the D1: was
first APE and then XF551.

And last thing: I really recommend: do NOT attach/detach any thing to your
SIO port if anything (whatever that is: atari, drive... pc...) is turned on.
I have 'blown up' a few 1050's by doing that.

Marius

It doesn't work - I get a device timeout error. :(This is the same whether I physically uplug the APE interface cable from the SIO chain or simply disable the drive in the APE software. After trying this and receiving the error, if I turn the XF551 back off and re-enable the virtual drive through the APE software the virutal drive still works properly.

> You say it works with MyDOS, what steps do you take to do that? Have the

Hmm... I swear I did this several times last night, but I can't repeat the process now in MyDOS. Kind of sad it doesn't seem to be working like I thought it was, but at the same time, at least it makes more SENSE now... And, btw, I did have the XF551 turned off during the switch when I was doing this last night, but not the computer, obviously. I must have been tired, 'cuz I don't know what I would have been doing differently than I am now.

> It is generally a good idea for both the computer and disk drive to be off

There are a few reasons I would like to be able to boot from APE drive #1 then switch over to physical drive XF551, but this may be my only option. I'm currently having problems copying images over, though, which is something I may soon post about as well... If I copy image to image with the emulator using DUPDSK everything works great. If I copy image to XF551 with DUPDSK I get a NO DOS error when I try to boot the disk. (I format the disk with XINIT before I use DUPDSK.) Just before I went to bed I discovered that if I format the disk with XINIT and WRITE DOS to the disk *then* use DUPDSK it seems to work fine. However, I have to try this again and experiment a little to find out what's going on. It doesn't make sense that I could duplicate image to image without first writing DOS to the destination disk but would have to do so to the physical disk. I did receive an error similar to "unable to write boot sectors" at some points when trying to DUPDSK to the XF551, but I'm going to have to try to duplicate these efforts and see if I can figure out what's going on. This is all new and strange to me...

Anyway, I guess I'm still looking for ideas on how it might be possible to switch from using APE drive #1 to XF551 drive #1 without turning the computer off... It sounds like this just might not be possible.

Thanks!

An interesting idea... Maybe someone will know how to do this in SpartaDOS. Do you know how I'd do this in MyDOS by chance? Perhaps I'm showing my green here because I did notice you gave the SIO command of $3F, but I'm not sure how to use that...

You may have noticed from my other post i nthis thread that I was unable to duplicate my effort to switch from virtual APE drive #1 to physical XF551 using MyDOS without turning the computer off. So I was either confused last night or there was something else thrown into the mix that I don't recall. Anyway, I'm unable to do this using MyDOS *or* SpartaDOS at this point.

Thanks!

Sean

MyDOS doesn't have a builtin highspeed SIO routine (unless you are using
a patched version), so this problem doesn't occur.

If you are using a non-standard OS with highspeed SIO support, then
maybe there's a possibility to reset the speed settings. You can do
this, for example, with the Romdisk OS by pressing shift-control-u IIRC.

The highspeed SIO routine which is loadable from Speedy drives can
be reset by calling it with DUNIT set to 0. But I guess that doesn't
help you here (even if the SpartaDos highspeed SIO routine acts
identically, you'd need to know the address of this routine).

> You may have noticed from my other post i nthis thread that I was unable to

Well, it could also be some kind of hardware problem (like static
charges etc).

Anyways, I really have to second what Marius wrote: don't (un)plug
devices while the power is turned on, you could damage your hardware!

But it is quite safe to do the following test:

Daisy-chain your XF551 between your Atari and your SIO2PC cable. Turn
off your XF551 and boot the Atari from APE. Now exit APE and turn on
the XF551. This is very similar to your tests, but doesn't require
pulling plugs.

Does it work now (at least with APE)?

Yet another test: what happens if you set APE to slow mode (disable
highspeed support)?

so long,

Hias

I definitely agree don't plug/unplug SIO cables with power on to anything,
computer or drive.
You did mention you used XINIT to format the disk before using DUPDSK. I'm
not famliar with DUPDSK, it sounds like a MyDOS menu command. You have to
format with MyDOS to use DUPDSK.
The 'no DOS' is the SpartaDOS boot sector notice.
You should use Disk Communicator or SCOPY (I hate SCOPY, it fails all the
time.) Disk Communicator 3.2 I think it is, Bob Puff.
I think MyDOS, DOS 2.5 use DUPDSK to copy all the files off one disk to
another. You want COPY disk I think, my DOS 2 is rusty.
What you want is a sector copy, not a file copy. You could set your xf551
to be drive D2: and boot from your APE, MyDOS, then do
a COPY disk from D3: to D2: or even swap ATRs and D1: to D2:
Then you have your boot copy on a real floppy and can make your xf551 D1:
(turn everything off, I remember someone says you should also unplug the
power from the drive, especially a 1050, before plug/unplug a SIO).
Long ago I wrote a program to set the density of a disk drive. It may be at
ftp.spudster.org I forget the name. Another way to change the density is
to turn the drive off, then back on after you've inserted the different
density disk.

I just got ahold of an MSS100, and it's a sweet little device (I believe
the only difference from the MSS1-T is that this one can do 100Mbps on the
backend). It is certainly cool to be sending bits out into the either from
my Atari! Now, to find (or write) a usenet reader for it...

I will never be bad again, I promise. :)

> You did mention you used XINIT to format the disk before using DUPDSK.
> I'm
> not famliar with DUPDSK, it sounds like a MyDOS menu command. You have to

DUPDSK.COM is on the SpartaDOS 3.2g disk I have and I believe it is a sector copier. It *must* be, actually, because when I use it to copy from a DSDD ATR image to a formatted DSDD ATR image the resulting image works perfectly. When I follow the same instructions to copy the same DSDD ATR image to my DSDD disk in the XF551 I get the 'no DOS' error. All the files seem to be on the new disk when DUPDSK is done, but the disk won't boot - even if I issue a BOOT command to the appropriate DOS file. (I tried SCOPY, btw, but the Atari, including the emulator, crashes.)

I'm starting to wonder if this is related to what Marius said about the XF551 being a bad density switcher. I know that the boot sectors (1-3) of (at least) a SpartaDOS DD disk are supposed to be single density sectors. I wonder if somehow the drive is formatting these three sectors as DD instead of SD during the XINIT command because the XF551 isn't properly switching density for these three sectors? And since the APE software probably doesn't exhibit this density switching problem, the images copied the same way work just fine. Does this sound plausible? If this is the case, though, I don't understand how using XINIT to format *and write DOS* to the XF551 before using DUPDSK solves the problem. Any thoughts there?

Well, actually, as I've been playing with this even more tonight I'm not getting anywhere... I can no longer duplicate being able to XINIT with DOS (32g still) before using DUPDSK and get it the physical disk from the ATR to work. If I run XINIT and write DOS files to the XF551 and boot that disk it doesn't even work. But, twice now, I've been able to switch from the Warp+ OS ROM chip to the rev C XL/XE OS ROM in my 130XE and get the floppy to boot after formatting and writing DOS with XINIT. And at that point, I can re-enable my Warp+ OS chip and the floppy continues to boot fine. It is the STRANGEST thing. If I start the whole process with the rev C XL/XE ROM in the 130XE the same exact thing happens. The disk in the XF551 won't boot until I switch to Warp+, or any other ROM chip, then a freshly XINIT'd disk with 32g written works fine. I can't seem to get a physical floppy of my DSDD ATR image to work at all anymore, though.

The tide is coming in and will soon be up under my house. My deck hangs out over the water... I wonder what kind of splash an XF551 would make?

> time.) Disk Communicator 3.2 I think it is, Bob Puff.

It appears Disk Communicator is actually used to turn a file into a bootable disk or a bootable disk into a file as opposed to being a sector copier. (Unless I'm missing something.) But thanks for the reference... Bob Puff sure shows up a lot, doesn't he? QUITE popular in these cirucles...

> If THAT is the problem he could test with spartados 3.3a ... that has no
> highspeed routine.

Well, with lots of help around these parts I was able to determine that the inability to switch D1: from APE to XF551 and back actually *is* related to the SIO routine. If I use SpartaDOS 3.3a I can switch back and forth with no problems, same if I use MyDOS without my Warp+ OS ROM chip in the 130XE. So, there you have it - at least I know what's causing the problem. I have a sneaking suspicion that there is going to be no way to be able to fix it, though - short of just using the slower SIO routines. I'm certainly all ears if there any suggestions in being able to start and stop the fast SIO routines at will. As was mentioned by Matthias, though, I'd probably need to know mroe about my hardware and software.

> And last thing: I really recommend: do NOT attach/detach any thing to your
> SIO port if anything (whatever that is: atari, drive... pc...) is turned
> on.

I will learn from your example. I actually wasn't doing this, but did try once at a previous suggestion. I didn't know it could ruin the hardware, though.

> MyDOS doesn't have a builtin highspeed SIO routine (unless you are using
> a patched version), so this problem doesn't occur.

The problem *was* occurring for me, but the reason apparently had something to do with the high speed SIO routine used by the Warp OS chip in my 130XE. When I went back to XL/XE revision C I was able to swap these drives with no problem.

> If you are using a non-standard OS with highspeed SIO support, then
> maybe there's a possibility to reset the speed settings. You can do

This is what made me realize that my Warp OS ROM chip might be part of the culprit - thanks... And thanks also for the rest of the information you provided.

You've probably noticed I have a branch of this thread (which I really need to rename the subject on) going on dealing with another aspect of the overall issue I'm dealing with here. If you (or anyone else) can provide any further assistance to augment that of russg in that arena I'd appreciate it. It has to do with trying to copy a DSDD ATR to a DSDD disk in an XF551. *That* is what I was trying to do initially when I got sidetracked due to having to keep switching the XF551 from D2: to D1: and back again to test the floppy.

> Can anyone tell me how to rescan the SIO chain for a drive change in SpartaDOS? .... <

Ok, I'm not a Sparta user, but I verified that this works with my XF-551 using Sparta 3.2g and Win APE.

1) Boot from an APE ATR image as D1:
Keep the 551 turned OFF, but connected.
2) Move the ATR image to another drive (I moved it to D5:)
3) Turn ON the 551.
4) Press SYSTEM RESET (which should force Sparta to re-scan the bus.)
5. As your first command, you might do a DIR to force any density changes or speed changes (although I don't think that is necessary.)

Now, a couple of caveats. Since many/most of SD's commands are external (extrinsic?) you need to put a Sparta disk in the 551. Also, if you don't de-activate/change the ATR drive, you will have two D1: drives on the bus and that won't work.

This really seems like the long way around booting Sparta, but I do much the same thing (switching drives) frequently since I have both 5-1/4" and 3-1/2" drives that are set up as D1: on my system. I've done this for many years, with no ill effects on the hardware.

Hope it helps.
-Larry

> it. It has to do with trying to copy a DSDD ATR to a DSDD disk in an XF551.

If you've got a PC with a 5.25" floppy drive running DOS or Win95/98/ME
you could use WriteAtr from my homepage http://www.horus.com/~hias/atari/

Writing DD disks in a PC works fine and WriteAtr also supports the
XF551 DSDD disk layout. Use option -f7 (360k/XF551).

If the disk won't boot with your XF551 it could also have to do with
the boot code in the first 3 sectors. The XF551 won't set the density
correctly unless you read sector number 4. So if the boot code isn't
aware of that booting will fail at the second stage (when the boot
code tries to load DOS).

The XF551 is really a nasty beast and won't work reliably unless you
are using software explicitly taking care about all of the XF551
weirdness. I guess the SpartaDos experts can tell you which version
works (best or at all) with the XF551.

so long,

Hias

> Hope it helps.

Uh, yeah. SYSTEM RESET? I've been PULLING MY HAIR OUT for *three days* and you tell me to hit SYSTEM RESET? hehe Yeah, well, it works. It works PERFECTLY, in fact... I can't believe the solution was so simple. And with the many things I've tried in so many hours I can't believe I didn't try that. And I can't even use the excuse that I'm new to SpartaDOS, since you said yourself that you're not a Sparta user.

Ah well - I learned quite a bit along the way and got to chat back and forth with some great people - which is what it's REALLY about. :) Thank you much!

I forgot a couple things:

- ICD MIO board
- CSS Black box (I'm aware these are still being manufactured, but I'd
prefer not to pay the "brand new" price if possible) - Does Black Box have
any distinct advantages over the MIO or vice-versa?
- XEGS with keyboard

183. P:R: connection max baud rate?

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-13 14:48:36 UTC
From: Slor <slor@comcast.net>
Message-ID: <Xns95DD63CB3BA69emuslor@130.133.1.4>
Source record: 13288

I've been searching the web, and I cannot find documentation for the P:R: -
I'd like to know what the maximum supported baud rate is for it. Been
trying to use one at 9600, but I'm losing characters from my output, and
I'd like to know whether that's unsupported or if I need to get something
configured more properly.

On the same topic, what would be the fastest bit rate at which the atari
can commicate, and what serial interface is required to achive it?

Thanks!

Hi,

> I've been searching the web, and I cannot find documentation for the P:R: -
> I'd like to know what the maximum supported baud rate is for it.

P: sents its data over the usual SIO interface at 19200 baud, the 850
and 850XL limit their baud rate to 9600 baud.

> Been
> trying to use one at 9600, but I'm losing characters from my output, and
> I'd like to know whether that's unsupported or if I need to get something
> configured more properly.

Possibly the terminal program you're using requires a somewhat larger
input buffer. The 850 uses an interrupt-driven read-routine that first
pushes data into a temporary buffer from where the CIO call extracts
its data. If this buffer is too small, it might overrun easily.

> On the same topic, what would be the fastest bit rate at which the atari
> can commicate, and what serial interface is required to achive it?

Hmm. Depends. With the interrupt driven IO as done by SIO, I would
believe 19200 is somewhere near the absolute limit. Polling POKEY
for serial input might archive somewhat better thruput, but I'm not
sure what this would be. At best, you might be able to read a byte
from Pokey around all twenty cycles, that would be approximately
four to five times as fast.

So long,
Thomas

Er well,
the A8FAQ mentions the chinese XE`s that were sold until 1992. These XE`s do have faulty GTIA`s as well as a new OS. Alas, the new XE-OS is not fully compatible with the older XL-OS that was used before. So far, I have found some carts (and disks) that do not work at all on these chinese XE`s and the XEGS. But I have not made a list , instead I sold the incompatible machines. The only carts I do remember are Pacman and Jungle Hunt, they did not work on the chinese XE and the XEGS, maybe your Defender cart is another entry... But maybe it is only the cart itself which is defect... -Andreas.

Source record: 13291

Well,
it is possible, as long as you use a version of Sparta DOS without ultraspeed, I guess. when booting sparta US via APE it inits the US driver and uses it. When you connect a XF551 then and use it as main drive, there is a problem, because the standard XF cannot do ultraspeed (which Sparta may still tries to do)... you simply end up with an error (139 or 144 I guess).

Why it works with MyDOS is simple: MyDOS does not use ultraspeed. so when using APE it loads without ultraspeed and when then switching to the XF it can access that drive, because it also does not use ultraspeed... -Andreas.

187. ABBUC Hardware contest 2005...

Hardware description:

------------------------------------------------
(brief & short)

------------------------------------------------

------------------------------------------------

------------------------------------------------

------------------------------------------------

My hardware should be registered for the following contest (please
mark):

o "best Hardware 2005"
o "best Hardware in development"
```

By signing the registration sheet, permission is given to publish the delivered documents for the purpose of distribution to all clubmembers (in the clubmagazine). The participant declares his acceptance, that his name, his adress and all belonging hardware documents and files of the contest will be released club internally for non-commercial purposes. He declares hereby, that no rights of third parties (of the contents), the delivered product respectively will be violated in any way. Any offence leads to the exclusion of the contest. The participant sets the organizer
(ABBUC e.V.) free from any juridical claims of possible copyright violations. With this sign, the participant confirms to have read and understood the following contest rules. Furthermore, the participant accepts the following contest rules and verifies his notification for the
contest:

Date/Sign: _____ /

_____

Please print this contest sheet and send it (filled-in and signed) via mail or fax to:

ABBUC e. V.
Ressort Hardware
c/o Andreas Mischka
Pfarrstr. 7
D-89165 Dietenheim
GERMANY
E-Mail: hardware@abbuc.de

----------snip
here!----------

1.1 Contest:

To promote the development of new hardware for the Atari 8Bit systems, ABBUC e.V. organizes a hardware contest. The rules and conditions for an unconditional german capitulation, err, for the participation at the contest are fixed in the following points...

1.2 Awards/Prizes: (Emmies, Grammies, Oscars & Golden Globes)

The following prizes will be given at the annual ABBUC meeting (JHV) 2005:
- main prize "best hardware 2005"
- extra prize "best hardware 2005 in development"

1.3 Contest Rules:

1.3.1 Quality check:
The hardware which should participate at the contest must be given to the
hardware ressort leader to make some pre-tests for admission to the contest. The tests will check the documented quality of the hardware

that
is ready for production. The sending of at least one fully-functional
product must take place after an agreement with the leader of the
hardware
ressort. After the contest / the annual ABBUC meeting (JHV) in October,
the hardware will be returned to its owner.

1.3.2 Preliminary Conditions:
Allowed for the contest is/are only hardware/upgrades for the Atari 8Bit
computer family (600XL, 800XL, 65XE, 130XE). We do allow a) any
hardware/
upgrades for the computers and b) independant hardware peripherals.
Modifications of already existent (hardware-) developments are excluded
from participation. Furthermore, the participant must guarantee, that
special software (operating systems, computer languages, applications)
is
not absolutely required to use the hardware, except if the software is
included with the contest hardware and free of any rights of 3rd
parties.

In special cases the leader of the hardware ressort (in collaboration
with
the chief of the club) will decide of an admission or exclusion.

1.4 Notification / Admission conditions:

- sending of a fully-functional hardware / upgrade and complete docs,
schematics, manuals, etc. for admittance to "best hardware 2005" (see
also 1.5 deadline!)

- sending of complete schematics and documents and manuals, etc. (e.g.
a prototype) for admittance to "best hardware 2005 in development".

- readable + understandable documentation and manual of the hardware in
german or english language.

- min. 3 photos in digital form (with a min. resolution of 1024*768
dpi,
24Bit color - a little bit more than the Atari 8Bit can do...)

The delivered hardware (respectively software) must be free of any
rights
of third parties. Any sendings, where a violation of copyright can not
be
excluded without doubt, will NOT take part at the contest. The
(hardware-)
models that are allowed for participating will be shown to the club
members with a functional description and photos in the ABBUC magazine.

1.5 Deadline:

The participating contest hardware and/or schematics, docs, manuals,
etc.

for both categories ("best hardware" and "best hardware in development")
must be sent in to the leader of the pack, err, the leader of the
hardware
ressort until August 15th, 2005 for testing / checking. Any hardware
and/or schematics, documents, manuals, etc. that has/have been sent too
late for testing / checking will NOT take part in the hardware contest.

1.6 Presentation of the Hardware:

The hardware / upgrades will be presented at the annual ABBUC meeting
(JHV) in October by its author/developer or a representative. If the
author/developer is absent at this meeting and did not name any
representative, then the leader of the hardware ressort will present the
hardware instead.

1.7 Publication of Winners:

The winners will be found (out) at the annual ABBUC meeting (JHV) in
October. The voting will be made with a voting sheet. It is also
possible
to vote via post/snail-mail. The voting sheet will be given to every
club
member with the ABBUC magazine that is published one month before the
annual meeting. The Deadline for the voting via post/snail-mail has been
set to October 20th, 2005.

1.8 Prizes:

The prize for the "best hardware 2005" has been set to EURO 500,00
(five-
hundred). The special prize for the "best hardware 2005 in development"
has been set to EURO 100,00 (one-hundred).

1.9 Final Conditions:

Any juridical way is excluded. A right of the participant(s) to perform
the contest does not exist. Should one category not get a prize, then
the
prize will go back to ABBUC e.V. Alterations and Errors reserved or
better: All rights reserved !

(End of official Hardware Contest Rules)

50% likely - I ended up with two of them, so the one on this machine may be
it. :) When you were working at 9600, do you happen to know what terminal
(and maybe version) you were using? I'm planning to try some different
hardware/software configs tonight to see if I can get anywhere. I feel I
MUST use 9600 if it should work!

Thanks

Based on the fact that I CAN communicate with the device at 9600 (even
19.2) and the result is a garbled display (I can also still give commands
to the hardware, which requires some timing finesse at 19.2), can the issue
be narrowed to the software? Maybe I should ask that backwards: can I
eliminate the P:R: Connection from the suspect list? If so, can I
eliminate the 800XL? If so, then I can be fairly certain it's the software
package.

Thanks!

One other thing - I did find one tech article that said you might want to
connect the DSR and CTS lines when using a null modem cable, which I don't
think are the same two that Marius mentioned needed connecting for the BBS
disconnects to work correctly on the server side:

http://www.atarimagazines.com/startv5n3/techtips.html

Any chance that not making this mod can cause issues with higher speeds, or
am I in good shape there if the setup works at all?

In general, CTS and RTS are a handshaking pair, as are DSR and DTR.
Both are used by a receiver to pause the sender when buffers are in
danger of overflowing. The sender may or may not honor DSR/DTR, but
will usually honor RTS/CTS, which is supposed to be a
hardware-to-hardware handshake. So with a null modem cable, RX and TX
swap as do RTS & CTS. That said, there is no voltage problem if you
use DSR and CTS, might work too- but they're not supposed to be used
that way. If these handshake lines are misconfigured, the liklihood
is you cannot transmit anything or, flow control doesn't work.

If you get any transmit chars out, but are dropping some, then the
problem is you're overrunning your transmit uart. The solution is to
send with a larger inter-character delay. The RTS/CTS stuff only
applies between your sending UART and the receiver- NOT to the Atari
and your terminal software. If your sending UART is full and more
data comes in over SIO for transmit, your incoming data is likely to

be dropped. Ideally, your sending software would obtain some kind of uart status before sending data, ie; "is the transmit register empty?"- but it might not be possible to do so...

If no chars are coming out at all, you can cheat by connecting RTS to CTS on the transmit side, then do the same at the receiving end- so you fool the hardware into thinking it can send freely- no flow control of course, but at least you can see if stuff is working.

Through the serial bus 19k2 max
When using an interface connected to the parallel port it might get higher.
The blackbox supports 19200 baud with a fantastic hardware flow control.

Thanks for the explanation. So, I'm not entirely sure if you're advocating
that I try crossing the lines or not... Are you thinking it could be
causing the flow control problem on the hardware end?

> If no chars are coming out at all, you can cheat by connecting RTS to

I do get characters ouput just fine, until I have it do something that
requires a lot of output in a short time. For instance, if I telnet to
another machine and do a directory listing. I end up getting most of the
characters from that, but a certain amount of it is missing.

What would be your recommended next step for me to try?

Thanks - I appreciate the advice!

This just in - It seems that the only terminal program that actually
WORKS is BobTerm version 1.23. I tested all kinds of stuff (including
older versions of BobTerm, but not 1.23) with a modem attached while I
was waiting for the MSS100, then I swapped the regular cable for a null
modem cable when I got the unit and put the newest version of BobTerm on

the machine. Now, I found this in the FAQ:

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 release that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
Available: http://www.nleaudio.com/css/ (version 1.21)
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/BOBTM122.ARC (com
only)
http://people.a2000.nl/becotel/archive/bobt123.arc (1.23)

That line about 1.23 being specific to PC XFormer... Can someone tell me what was specific to the emulator and what that means as far as my setup being misconfigured? Perhaps BT 1.23 did something to use a different signal, and that means I need to cross those two mentioned above?

I think I'll have to give it a shot - I just don't wanna ruin my cable along the way! :)

This has become more complicated and more frustrating.

I never did get the ATR8000 working with two floppy drives. I changed cables, making one from scratch. I tried adding/changing termination, 1K, 330 ohm, and 150 ohm resister networks.

Either drive works alone as drive 1 (DS0) and boots fine but the moment I add the second drive then neither drive works. Doesn't matter which one is configured as drive 1.

Here is a new wrinkle.

I finally got an SIO2PC cable (1 chip model) but I have similar problems.

I can run the Atari 800 with just the ATR8000 plus 1 floppy or I can run it with APE (or SIO2PC) enabled but I can't do both.

If I configure APE with one logical drive set as drive 1 (using a MyDOS 4.53/4 ATR file) and the ATR8000 drive set as drive 2 the Atari boots but I can't access the physical drive. Atari displays error 160 The physical drive never spins.

If I reverse this and set the ATR8000 floppy as drive 1 and set the logical drive in APE as drive 2 then the Atari immediately jumps to "ATARI COMPUTER - MEMO PAD". The drive never spins!!!

APE does indicate that commands are being issued by the Atari. I can read Device $31, Command $53, and Checksum $84. There are several of those. There is also one device/command that is issued that I can't read. It goes by too quickly.

No matter what I do I can't have two drives going if even one of them is a physical drive.

Plus, I can't even boot the Atari from one physical drive if the SIO2PC cable is so much as attached. Doesn't work if the PC is on, off, or disconnected. As long as the SIO2PC cable is attached at the ATR8000 end then the Atari won't boot, not from a physical floppy.

If the ATR8000, one floppy, and nothing else is attached to the Atari then I can boot from floppy.

This has me stumped!

For those that requested a copy of the CDs that Holmes gave me before he shut down his website, I have now sent them out.

Some people expressed an interest in the CDs that are full of all the Atari Games, but did not contact me much afterwards. If you are still interested, send me an email, with a reply to this above subject header (I get a lot of spam mail and need to weed it out).

201. MyIDE Image Manager v2.0

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-14 05:39:32 UTC
From: Shawn Jefferson <shawnjefferson@shaw.caREMOVEPLS>
Message-ID: <8ameu097qqnmuaio4vpa7okmddsjhsd7hn@4ax.com>
Source record: 13356

Version 2.0 of the MyIDE Image Manager is ready.

Features:
- 30 character description for your images
- rename or modify images
- assign categories to your images, as well as view by category
- 20 fully editable 4 character category names
- substring search your image names

New in version 2.0:
- major bug in create image routine fixed
- larger sector buffer for faster image copies
- categories added
- cosmetic changes
- image table is incompatible with previous versions, sorry!

Please read the accompanying documentation.

Also, just released MyIDE Config v1.0, allows you to swap your partitions drive letter assignments around, create and delete partitions with more flexibility than FDISK.BAS, as well as configure the option byte parameters.

There is a short text file describing the keys and the basics of what it does.

Get them both here:
http://www.jeffersonsauctioneering.com/atari/myide/

Feedback, enhancments requests and bug reports most welcome. Send to sjefferson [AT] shaw.ca.

Shawn Jefferson

> eliminate the P:R: Connection from the suspect list? If so, can I
> eliminate the 800XL? If so, then I can be fairly certain it's the software
> package.

I would first suggest to try a different terminal program and see whether
the error remains. Then whether the error remains at lower baud rates. If
the terminal program provides means to adjust the input buffer size, try
there.

Which kind of commands are you sending? In case you're just trying to
communicate a modem, a simple "ATZ" should come thru, and the result code,
an "OK" should not depend on the size of the input buffer (unless it's
smaller than two bytes, that is. ;-)

If buffer size is a problem, the typical answer is to try something like
hardware handshake (connect CTS,RTS). However, IIRC that's rather point-
less for the Atari. Both lines are software controlled, thus the 800XL has
to read and trigger them, but in case you're receiving data "as it" from
the modem, the R: interface has to be switched to concurrent mode - which
basically means that it arbitrates the SIO bus completely and no other SIO
commands fit thru. Including those that detect and set the RTS/CTS lines.
Thus, a pretty pointless feature for the Atari anyhow...

So long,
Thomas

It sounds like a uart somewhere is being overflowed. Please supply
some details about the connections you have set up; what machines, how
connected, who is sending the data, etc..

See my new post on what I found with other programs. It seems I have a
more broad issue of getting my connection right for my setup. With the
single program that works (BobTerm 1.23), 4800 baud has no flow control
issue.

As I noted in my later post, it turns out that only BobTerm 1.23 even works
with this setup, so I probably need to figure out what the deal is there
first.

My initial setup was:
- Atari 800XL
- P:R: connection with serial cable to convert to standard pinout
- Standard modem
I could talk to the modem using every terminal program I tried.

My current setup:
- Atari 800XL
- P:R: connection with same serial cable plus standard null modem adapter
- MSS100 device server
Now I can only talk to the device using BobTerm 1.23, which leads me to
believe I need to do something else with the cable conversion.

Well, I gave up on dialing out to Texas for now because I don't want
to deal with the long-distance charges. How would I go about telnetting
to BBSes using my PC as a gateway with APE and a SIO2PC interface? I
saw that APE has the R: handler internet modem emulation. What's next?
Any software? Thanks!

210. Re: *solved* SpartaDOS 32g & XF551 not booting

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-14 16:26:06 UTC
From: Gork <nokraygienspam@hotmail.com>
Message-ID: <10ufslmnfirie76@corp.supernews.com>
Source record: 13365

Note: I changed the subject line from "RE: Re-scan SIO chain for new drive in SpartaDOS" to better indicate there were two issues discussed in this thread.

First off, I want to thank all the help everyone gave me over the past few days with this. The XF551 is a brand new monster to me, and since I have only every used an 810 and a 1050 (single density only) I have never bothered to really use SpartaDOS or MyDOS (though I've had access to them for years), so I am new at *all* this stuff. I can't *believe* the helpful responses I received, and I really appreciate it. Oh DEAR. Is that a tear running down my cheek? :)

I located two public domain programs called Bootfix and XinitFix - "The SpartaDOS boot-up utilities for the Atari XF551" (c) 1989 by James R Harris.

There is apparently an issue with the XF551 not reading a DD disk the first time you boot it and you often have to boot a second time to get it to work. If you've been following this thread, you know my problem has been that the disk NEVER boots unless the planets align with the moon at a 90 degree angle during a total eclipse of all Jupiter's moons. But, these programs were written to solve the one problem, so I thought I'd see if they'd solve my problem as well. And, they did. More specifically, XinitFix did - I have no need at this point to try Bootfix.

XinitFix is a BASIC program that changes Xinit.com and creates a file from it called Xinit.551. When you format a disk with Xinit.551 it writes something different to the boot sector(s) which fixes some kind of a problem associated with the XF551 drive. I simply used Xinit.551 to format a disk in the XF551 in DSDD format, then used DUPDSK from the SpartaDOS 32g disk to sector copy my "DSDD" ATR image to the XF551. The resulting 5.25" DSDD floppy boots just fine, and I have duplicated this twice.

I wish I knew exactly what these programs change in the boot process, and I have no idea if the change makes the disks unbootable in other DSDD drives. If I learn anything of this nature or have any problems as I use this Xinit.551 in the near future I'll report back. In the meantime, it looks like I have a working solution to BOTH problems I brought up in this thread and am a VERY happy camper. (And after staying up until after 6am before going to work at 3pm for the past three days, I'm a very TIRED camper as well.)

Thanks again.

> If you've got a PC with a 5.25" floppy drive running DOS or Win95/98/ME
> you could use WriteAtr from my homepage http://www.horus.com/~hias/atari/

Thanks for the offer and your other helpful comments as well. Alas, I do NOT have a 5.25" floppy on my PC. I have been considering getting one because of this sort o a thing, but with my APE/PRO combined cable and my APE/Pro System software it seems to be doing what I need to do at this point so I haven't been in a hurry to look into other options.

That said, I did find a fix to the DSDD XF551 disk not booting and posted that information in that part of this thread. I hope you'll take a look. I also hope someone is familiar with the software I mentioned and tell me a little more about it.

http://www.best-electronics-ca.com/ has XF551 drives, but they're not cheap. I've not dealt with them before, but I am considering trying them out for a second XF551... (I recently obtained the one I have on eBay.) I've also noticed at least one other of the regular Atari dealers sells used XF551s... They seem to be in the $175-$200 price range.

This is too simple to probably be possible, I seem to recall that you mentioned, earlier in this thread, that you're using Tucker's APE software. Have you tried changing the Advanced Drive Settings and closing down the I/O speed? It's probably a shot in the dark, but it doesn't sound like anyone's with you in the darkness, so you probably wouldn't have to worry about anyone getting hurt...

There was one other thing that I meant to mention and didn't. I never understood why users of SpartaDOS took the time to write their "ultimate utility disk." But now I've spent several hours doing just that! I have 692 sectors free on a 10080 sector DD ATR image with a few different versions of SpartaDOS and more tools than I'll ever need. And with the solution to my problem I originally posted solved, I can boot this image via APE, switch the image over to drive two and use my XF551 as drive 1 if I want - or whatever. Very nice indeed.

FYI - I have dealt with Best for a couple other purchases, and they're good to do business with. You'll get timely replies and quick turnaround. I have a couple other types of drives, so I'm trying not to break the bank to add the XF551 to my setup.

Thanks for the pointer, though, just in case... :)

I'm not current so there may be other or better ways of doing it.

You can do it if your ISP allows shell accounts. The shell accounts are
kind of like a super Hayes command set. Shell accounts allow you to use
an ANSI terminal to run programs on the ISP server. If you want to read
newsgroups with your Atari you would just type in a command like 'rn' or

call up one of the other newsreaders. You have to find just what
programs your ISP has available before you can find the commands. Just
as a few for instances: Typing 'pine' brings up an email program, typing
'pico' brings up a mini word processor, typing 'telenet' brings up telenet.

I think the top rate of 19k is because all the drivers and terminal
software was written before anything faster was even on the horizon.
Most devices like USD or APE run high speed which is something like 38k
or 57k. The top rate for the SIO clock is something like 112k baud which
is the system clock/16. Of course it would need something close on the
IBM side to do this. IIRC the chip set they use has fixed baud rates
built in so you wouldn't be able to set the serial port to exactly match
the Atari.

218. 8-bit networking

I just tinker with my 130XE now and then. I primarily use STe and Falcon. I have my 130XE connected to my STe with an SIO2PC cable and 800XL DeeJay. I was wondering if anyone had thought about using SIO2PC as a networking device rather than just emmulating drives. Since my STe is connected to my ethenet and cable modem, I would love to be able to telnet to a BBS through the network, or send/receive e-mail or even text browse the web. I'm not a programmer, but I thought this might be a cool challenge for those who can do this sort of thing.

The Drives should be connected to the ATR8000 with a Straight thru
floppy cable. One drive jumpered as DS0 and the other as DS1. (DS1 and
DS2 on some drives) The drive at the end of the cable should be
terminated. This is how mine is configured and it works. It sounds
like you have tried this configuration so I can't say what your problem is.

Regarding your problem with the SIO2PC cable, I have heard that the one
chip design does not 'play nice' with other devices connected to the SIO
chain. I have a 2 chip design and it works fine with the ATR connected.

True but that can be fixed ofcourse. If the hardware IS able, then we should
improve the drivers and the software I guess. (By the way I think 19.2 is
fast enough for any thing on the atari 8bit)

> Most devices like USD or APE run high speed which is something like 38k or

I think it is even faster... But I'm not sure YET. I can find out ofcourse.

Thanks for your contribution

. I was wondering if anyone had thought about using
> SIO2PC as a networking device rather than just emmulating drives.

Yes, but not for ST(e)/Falcon I'm afraid. It is possible with PC and with
atari 8bit stand-alone (with lantronix).

Look at my bbs and see the TechInfo of my BBS. You will read some
interesting stuff about the lantronix Serial Server.

Thanks JR. I had read something to that effect but after I had already received the cable. I think I read it in the APE FAQ.

The dual floppy config has me puzzled. It worked at one time. I know it did. Years ago I was playing with APX Pascal which requires a dual drive setup. I've never owned any other drives for the Atari. Straight-thru cable is what I used.

I'm beginning to think there might be something wrong with my ATR8000. I can't find the manuals but I don't think there was any hardware or software configuring required for Atari support. I think the only time changes were required were when the ATR was switched over to CP/M mode.

I tested CP/M once, years ago. (I wonder if mucked up the ATR8000?)

My guess is the MSS100 is not handling the flow control lines properly
(or at all), and your local uart is being overflowed. I'd try hooking
the rts/cts signals up- unless you can find some documentation on how
the MSS100 does rs232 flow control.

Right, faster would be very limited. Maybe transfers with the screen
disabled. Whatever buffer you have an Atari would be filled fast at that
high a rate and then you would be stuck dumping it somewhere like a
floppy. I could only see it being necessary if something happened like
an ISP/BBS only allowed faster connections.

I only read at ~2400 baud and type at 300, so anything more then that is
wasted on me.<grin>

I used an Atari ST to connect to the UNIX servers at my school and program on it once. Through this, I was able to telnet and all the stuff that UNIX allows, including download. I also remember downloading someone's picture once, and finding a program that was compatible to view it (just not very well).

Marius has been kind enough to send me a set of wiring instructions,
including what he uses for his connection to his MSS unit. Hopefully, I'll
be off to a better start once I build the better mousetrap (or cable
anyway).

Thanks for all the input everyone.

Howdy folks

I have:
- added a quick course in how to write software that works with the ASPI manager.
- added 5 versions of MyDOS.
- put in a link that should make modelltrain lovers drool.
- added a new MultiJoy(16) game
- added some idea's on how to improve the MultiLink interface
- etc.

Check it out at my new url: www.mathyvannisselroy.nl

I didn't see the options you spoke of in the DOS version of APE. At the time of the viewing of your message this is the only version I had installed. Since the DOS version I have is the unregistered version I do believe the ultra speeds are disabled.

When I finally installed APE trial for Windows I found something else (see my other post). Hopefully I'm on the way to a solution.

OK, I might be making some progress in regards to using the SIO2PC
cable

I installed APE for Windows trial version. I had been using the SIO2PC
and dos version of APE because this is an old and slow K6-2 box.
Anyway, the Ape hardware wizard led me in what I believe is the right

direction. It indicated that APE detected data on COM1: but no control activity. Switching to manual configuration I learned that my PC's UART does not fully support the method of coummication that APE uses. It, APE, suggests I reconfigure my cable to use DSR instead of RI (ring indicate?).

Before I modify my cable does anyone have any thoughts on this whether it is worth trying? I'm not the handiest guy with a soldering iron but I can manage this mod.

Thanks in advance.

Steve Sheppard

Ok, so i have a 130xe with an ill keyboard. One column
doesnt work at all (2,w,s,x keys).

Before i tear this apart and look for cracked traces, am i just
wasting my time and instead a chip normally goes in these things?

No, that's pretty typical of a bad trace on the mylar keyboard, or
connector to the motherboard.

The one that I have that works with the ATR8000 is Atarimax's Universal
Interface:

http://www.atarimax.com/sio2pc/documentation/index.html

I just checked my one chip interface built using this design:

http://www.geocities.com/atarimods/howto-sio.html

It works with most drives but when I connected it to the ATR8000, the
ATR Drives are not recognized by the ATARI.

Here's the raw HTML frame of the page he was talking about, I think:

BBS The Atari Inside - Technical Details
http://home.planet.nl/~diepe534/ainside/techdetails.htm

It mentions the Lantronix device, and links to their page with specifications:

Lantronix > Products > Device Networking > External Device Servers > UDS-10
http://lantronix.com/device-networking/external-device-servers/uds-10.html

Enjoy!

Hey Joe,

Nice to see you are using 800XLDJ like me. Great program. Works great with my STe and Hades060. I have heard that someone is working on a cartridge that will allow the XL/XE to be networked to a LAN/Router system. When it does come out, I will surely get one. Your idea of using the SIO is a good one also.

Jerzy Dudek (in Poland)sells a FINE ECI IDE interface.

jurek@cnd.pl

KMK/JZ IDE Interface for the XE

This was my Christmas present to ME this year!

As soon as I can find time,I will have it up and running,and
I will post a report here.

This is a very professionally made unit and Jerzy tells me
that he will have an adaptor soon to use it with an 800XL.

I ordered it from him in Poland and considering the distance,
received it pretty promptly (four weeks).

Bricks, huh? People get fired up about some of the strangest things... :)
I have actually heard the same thing about the Indus GT. However solid they
were/are, though, as I recall, they don't do double sided like the 551,
right?

So, a question then... Have you had the chance to try using a disk
formatted in an XF551 and updated with BootFix on a different DD disk drive?
My biggest concern with using this program is that the disks could be
incompatible with other DD (or DSDD) drives, but I have no other DD disk
drives to use for testing...

I've been thinking about looking more into one of the ROM upgrades which
were released for the XF551, but I've never done any soldering and don't
know if I want to get into that mess. I know NOTHING about electronics
<sigh>. I wish I would have taken electronics in high school instead of
worthless (for me) wood shop. Heaven forbid I take a class *now*!! I was
actually pretty amazed I installed a Happy board (no soldering or drilling
for this version) into a 1050... Sad, huh?

Hias, what a great utility! Thanks!!! I can dump an ATR to a real
floppy (SSDD) in under a minute. I love it. No preformatting needed.

Combined with the magnet trick (to erase my old DD PC disks - thanks
Larry White - it works!) you've got something incredibly useful, and
fast, fast, fast!

Thanks again Hias!

Steve Sheppard

253. Mounting interface inside Atari 130XE

Newsgroup: comp.sys.atari.8bit

From: jamie@soundforgames.com
Message-ID: <1105820251.375863.47580@z14g2000cwz.googlegroups.com>
Source record: 13158

Hello,

I am trying to mount a PBI-based interface inside my 130XE. How do I make the connections to the PBI inside the computer?

The interface has a cartridge connector. It looks like I could solder a bunch of tiny wires, one at a time, to it on one side, and the inside of the PBI on the other side. But it looks like the wires would never make a solid connection, because they'd all be sitting on the flat cartridge board one next to the other. Is there a better way to do this?

Thanks in advance for any assistance.

Best regards,
Jamie

Yes you should be able to find all he ST games online and they can be
easily put on disk. Logo was used to teach basic concepts in
programming, which I suppose would be just as valid now as it was
then. As far as real world things, like I said it was not really
designed to write serious applications or games, more as a tool to
learn programming for the beginner.

The only other DS/DD drives that I have are Percomms that I don't use
much.
They use standard (PC) drives and will read and boot XF551 formatted
disks.

Here come the bricks again,but I just don't like the Percomms.
(vertical orientation,for one.Lay them on their side and they
get VERY warm.)

Ok, Full Speed is partly working. We can speak to some (but not all) USB
Sticks, USB-RS232 Converter, Digital Cameras, Hubs... (this don't implies
that we will write driver for all that stuff, but it is possible if the
protocol is open). We have so far access to the Descriptors in the device.

A new USBTEST Tool will be released on Sunday, 16th Jan 2005.

Best regards

Carsten

Hi

I used to have a game (I don't recall who made it) for Atari 400/800 called "Dodge Racer".

Does anyone know if there is a ROM of it out there for the various emulators?

I use Atari800MacX for OSX, but I guess the ROM would work on any emu...?

I've been looking for this one for EVER!

thanks

JT

I found an ATR of it in Holme's CDs. I'm not up-to-date on download sites,
where you might find it. Maybe someone else will know where you can get it.
Or, I checked B&C (www.myatari.com) Bravo Sierra, Best and Video 61 to see
if you could order it, a quick check, but didn't find it. I never heard of
it before.

261. P:R: connection max baud rate?

Source record: 13166

On 13 Jan 2005 at 23:32:37 GMT, Slor scribbled:
->I do get characters ouput just fine, until I have it do something
->that requires a lot of output in a short time.

Sounds like you need to be able to set a delay rate, which I re-
member doing with 850 Express back when I was using my 8-bit for
modeming. That was more than ten years ago, but for many years
before that I had used a P:R: Connection as my interface and I never
had any trouble with it datawise.

In July 1995 I obtained a big 8-bit collection from one of the
locals who had long since moved on to an ST and later to what we
used to call "IBM." In it I found a commercial Atari 8-bit termin-
al program dated 1983 called Chameleon which could be used at 4800
or 9600 baud. (You have to imagine that for Atarians in 1983, when
300 baud was the norm, 9600 baud was like saying one-zillion baud
today.) Chameleon allowed for connecting to four different types
of platforms, mainly "big" computer types. I tried out the 9600
baud setting for an IBM-mainframe but I don't recall succeeding in
connecting to anything.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Source record: 13168

On Fri, 14 Jan 2005 at 17:22:52 GMT, Rick Cortese scribbled:
->You can do it if your ISP allows shell accounts. The shell ac-
->counts are kind of like a super Hayes command set.

I think there's a more straightforward way to describe it.
"Shell" refers to a Unix shell program, which runs on the ISP's
computer. It's equivalent to so-called "MS DOS" on what we used to
call IBM-clones, or command-driven DOS programs on the Atari 8-bit.
The concepts are the same but you just have to learn different com-
mands and Unix syntax.

On your end you run what IBM-ers used to call a communications
program, which Atarians refer to as a terminal program. Your own
computer becomes a "dumb terminal" operated by your keyboard. I'm
doing this right now, but on an IBM-clone, not an Atari.

->Shell accounts allow you to use an ANSI terminal to run programs
->on the ISP server.

I quibble with that. My IBM-clone is an ANSI terminal but the
Unix environment I've been using it in for the last decade is not.

->If you want to read newsgroups with your Atari you would just type
->in a command like 'rn' or call up one of the other newsreaders.
->You have to find just what programs your ISP has available before
->you can find the commands. Just as a few for instances: Typing
->'pine' brings up an email program, typing 'pico' brings up a mini
->word processor, typing 'telenet' brings up telenet.

These are names (as well as commands for running them) of Unix
programs. I'm typing this in Pine (which I'm starting with a capi-
tal letter for the sake of conventionality) in order to post on the
NG, but for reading I prefer a newsreader called Tin. Pine and its
w.p. sidekick Pico are programmed by and distributed by the Univer-
sity of Washington and are supposed to be among the easiest such
programs to use. When you subscribe to shell service you get to
use these programs free, and when updates of active programs come
out they're sent to your ISP. There are also other Unix programs
you can run when you're connected to the ISP in shell mode.

265. DGS Atari 8-bit CD compilations - banned by eBay!

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-16 12:22:19 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1105878585.64577.0@dyke.uk.clara.net>
Source record: 13170

Hello All,

As you may all be aware, a couple of years ago I started selling our (DGS) range of software on CD-ROM in ATR fornat with PDFs of the manuals. Firstly, this was just through our own site (http://www.dgs.clara.net). More recently, I have listed these on eBay too, to make it easier for people to order and to attract a wider audience. I have been listing them for many months now, until a couple of weeks ago when eBay removed them accusing me of selling 'anauthorised copies'. Many e-mails have gone back and forth, with me providing evidence of copyrights, distribution agreemens, etc., but they still insist they aren't legal. They've even banned me from selling the PD CD compilation, which I really don't understand! How can PD software violate copyright?!

Unfortunately, there's no reasoning with them, so I won't be able to sell them on eBay anymore. They are still available directly from my site: http://www.dgs.clara.net

Depends on what you define as 'real world'.. If you want to write
documents, draw pretty pictures, run spreadsheets, learn to program,
surf the web (though with additional work).. then yes its 'real world'

If you want to run the latest and greatest game from the store, then no...

Or you can just give it to me (heh.)

While it may souund silly, they are now erroring on the side of safety
as if they alllow things to be sold that are not legit, they can be liable..

So.. those that are legit will suffer..

As a side note, I doubt they even understand what you are selling....

I would agree that they don't understand what I'm selling. They claim it contains ROM copies which aren't allowed. There are no ROM copies on the thing, but they won't accept that!

That's weird. I don't have it in my collection and I can't find it anywhere either. I *thought* I had every game. =oP Oh well. Too bad Holmes site doesn't work anymore. It might be on ftp://spudster.org but I can't seem to get into any of the ATR folders it just times out.

Hey fellas

Someone emailed it to me.

It was a pretty obscure game in the first place (the file sent to me
revelas that it was made by Synapse Software, and I remember that it
was distributed on a cassette, not a cart), but I am stoked to have
found it.

It's a pretty remedial and simple game, but my sisters and I played it
for hours and hours 'back in the day' blah blah blah.

...and, for all of you feds out there, I *bought* the game in 1981 or
so, so this 'backup copy' is legal for me to own!

Actually at least two of my former shell providers not only allowed me
to run standard programs, they let you use the C compiler and run your
finished programs on the server. I know it probably wasn't a good idea
but what the heck!

276. SWP ATR-8000 and floppy drives - SOLVED.

The cause of the problem was user error! I had the wrong settings for
the floppy drives. See below.

A DIP socket is labeled as follows

HS
DS0
DS1
DS2
MX
DS4
HM

Notice there are 7 selections.

The switch pack that sits in that socket has only 6 switches and 12
pins.

I had the block covering DS0 thru HM. For each drive I had the drive
number (DS0 for one, DS1 for the other) and HM closed. I don't know
what HM stands for but with it selected both drives seem to get a motor
on signal at the same time. Both would spin up but I could not access
either of them until one was disconnected from the data cable.

When I moved the switch pack to cover HS thru DS4 I found to get any activity I needed to close DS0 or DS1 (per drive), plus HS and MX. MX seems to be independent motor control. I have no idea what HS is but it had to be closed to get any response.

This is all that was needed.

Sorry to trouble everyone.

I still can't get the floppy drives to respond when the SIO2PC cable is attached but now I know it truly is a separate issue.

I think the copyright on these games expired already. =o) Besides, who is going to come after you for a 20+ year old game lmao.

I have trouble with ftp.spudster.org also. I should download the all.zip
file to be up to date.
I wonder if spudster can fix the site.
My Int Explr times out once I'm in the correct directory, the flashlight
just keeps going back and forth.
If I use DOS ftp client, I can get one screen of files (with a ls in the
chosen directory), then it locks up.
I was able to download a file from a directory if I already knew the
filename (get filename.ext command in ftp).
I thought it was my IE, but I'm thinking something is wrong with the site.

You really should specify that it is for Windows users only. You have to
register with the forum to get that info.

Not that it can't be run from my Linux machine, but still.

Terry

Are you configuring your modem? You can set the modem to work with a
certain speed (ATN0, ATS37=8 for 4800, say).
And you definitely need to turn off compression (I don't remember that one,
maybe AT&K0?). I remember 4800 being the fastest I could go reliably with
either the P:R: or the MIO, of course, I'm not in too much of a hurry.

Ahh yes, you don't have an old PC lying around somewhere? The system
requirements are very low! It would be worth it to install Windows just to
play M.U.L.E online don't you think?

I'm pretty sure it's a problem with the site because I have no problem
using FTP anywhere else.

Cheers

Does anyone know if there are any intentions of implementing network play
via TCP/IP? Atari800WinPlus v4 has Kaillera built in, but it uses UDP and
is VERY temperamental.

Depends on what you define as 'real world'.. If you want to write
documents, draw pretty pictures, run spreadsheets, learn to program,
surf the web (though with additional work).. then yes its 'real world'

If you want to run the latest and greatest game from the store, then no...

Or you can just give it to me (heh.)
If I wanted the latest and greatest I probably would not have chosen or
accepted the Atari,it takes some getting used to. I am hoping that some
technological genius will come and laugh at us while he helps us to figure
things out. I think the kids will enjoy writing and creating pictures. I did
not realise that it was internet capable.
Thanks for your input

> the new XE-OS is
> not fully compatible with the older XL-OS that was used before.

The OS you mention (BB 01.03) is 100% compatible. Most differences are inside SELF TEST part of the ROM, which shouldn't affect compatibility. The only substantial difference outside the SELF TEST is that there are two instructions swapped in the routine initiating serial input. AFAIK, this change makes completely no difference in the computer operation.

However, this means that the OS differs in:

- version number
- revision date
- and the ROM checksums

If a program depends on the ROM checksum, well, this is not the OS's fault that the program doesn't work ...

K.

I am sure that a lot of you Atari users once had an Atari 8-Bit computer back in the day. Maybe you still do. You might remember a classic game called M.U.L.E. A game that you wish would have been ported over to the PC but never was.

If you are a M.U.L.E. fan like I am, you probably used to have hordes of your friends over your house to play the best 4-man multi-player game ever written! After playing this game for hours upon hours, days upon days, years upon years, finally everyone grew up or grew apart and stopped getting together to play.

If you are a M.U.L.E. fan like I am, you probably have done a bit of M.U.L.E. re-searching on the internet, in hopes for one day someone to create an internet capable version of this great classic.

Well, I have some very good news for you. If you run Windows (98/XP) operating system, THE WAIT IS OVER!!!

Thanks to the authors of the Atari800WinPlus (http://atariarea.histeria.pl/PLus/index_us.htm) and Kaillera (www.kaillera.com), you can now play the greatest multiplayer game ever made with 4 players OVER THE INTERNET! This is not a clone, it is the ORIGINAL M.U.L.E. un-modified! Same graphics, same sound, same game! The only difference is that it looks a lot better on your computer than it did on your TV back in the day!

If this interests you, please hop on over to http://atarimule.neotechgaming.com where M.U.L.E. fans from around the world have been gathering and playing online!

Some of our members include the authors of the most popular M.U.L.E. web sites such as World of Mule (http://www.worldofmule.net/index.htm) and Extreme MULEing (http://mule.eichberger.net/index.php) and M.U.L.E. Fans (http://www.100hosting.com/mule/). Even the creator of the recent M.U.L.E. clone game Space HoRSE (www.gilligames.com) has joined up with us!

Ahh, the feeling of playing with 4 human players again is quite exhilirating! SO, what are you waiting for? Join us now!! http://atarimule.neotechgaming.com.

See you there!

Adam

Copyrights expire, but somewhere around 75 years AFTER the authors death,
or something to that effect, so any video game copyrights are certainly
still intact.

Of course you are completely right in that not many people will come after
you for posting a 20+ year old game on your website or FTP (with notable
exceptions of course.)

Probably because Video61 took the 3.3 version and just put it on a
cartridge. SpartaDOS X is significantly different than 3.x (well IMO
anyway.)

Has anyone purchased and used 3.3c? I'm curious how it compares to
SDX -- since SDX is a bank-switching 32K or 64K cart (IIRC) with many,
many features. Is 3.3c bank-switching, or is it a regular 16K cart
with a permanent footprint in memory?

I have one. I don't claim to know a whole lot about bank switching and memory and such in the 8-bits, but I can tell you that the SIZE command in Assembler Editor returns 0000 0000 9C1F on my 256MB machine. I actually wrote Steve a couple days ago to find out what all it does, and he said he forwarded my question to the developer who transformed it to be put on a cartridge.

If you'd like me to give you the output from anything else run with the cart, gimme a yell.

Not that it helps you find one, but ive also found that heat during
storage will also cause yellowing. (such as in an attic).

Id love to find a way to 'undo' the aging. I have a couple of machines
that have yellowed.. Though strangely enough other equipment has not..
Im guessing they used differing qualities of plastic..

FYI - Perhaps this is obvious to you guys who have used other cart-based
DOSes (dunno how the others work), but this is a "boot and pull out" sort
of deal. i.e. You take the cartridge out after it initializes...

It's not a boot and pull out thing. You boot and leave the cart in, then additional programs are built into the cart that are accessible without needing them on disk/diskette.

No, I'm saying this particular 3.3c cartridge IS a boot and pull out. It
even tells you on the screen to pull it out, and the Atari machine goes
nowhere until you do (unless you know something I don't). The additional
programs come on a companion diskette.

Sorry, I was more referring to the SpartaDox X cartridge. Seems a waste
to develop a SpartaDos 3.3 cart that requires removal after bootup.
This would only be beneficial for situations where no OS existed on a
hard drive partition, etc..

I haven't used it much until recently. Now I'm curious what it does, since
I saw the numbers shown for free memory after boot.

So, the SDX cart stays in and contains all the external utilities, correct?
And I assume you can still load up built-in basic?

Yellowing is due to age, heat and belive it or not, many kinds of
plastic yellowd when exposed to UV light over time. Keep in mind,
florescent lights emit UV. Yellowing from smokrs is due to tar, and
it cleans up with a medium detergent or solvent. Obviously you can't
clean the circuitry that way so it is desirable to have one from a non
smoking environment. I'm just pointing out that yellowing on the
outside case is not the true test of it.

Source record: 13221

I go to ftp.atari.art.pl using Win98SE DOS ftp command.
I log in, using anonymous and russg (user anonymous) pswd russg.
Now, ls gets the directory of the 'root'.
I 'cd' to the directory I want, until I get to where files are, instead of
directories.
My problem is I can't stop the file listing at each page, it just scrolls
off the screen in a millisecond.
I've tried 'ls |more', 'ls | more', and anything else I could think of, but
can't figure how to get a directory listing that stops at a page.
How do I do this?
I know 'pwd' to get current directory.
I know 'cd ..' to go up one directory (cdup doesn't work).
I've looked at UNIX/Linux command lists and they say the 'more' will work.
This isn't a general question, but a specific question for
the site mentioned.
Thanks

I guess the attraction is that it loads instantly. I suppose it does the
same thing that the Atarimax Flash Cartridge is doing: copying the program
into the proper location (not running it from the cartridge addresses.)
The Atarimax Flash cartridge is smart enough to turn itself off afterward
though.

Sure, if you have a any claim to the rights for Frogger...
This from the FAQ:

According to Lance Ringquist:
K-Products contracted FTe to develop SpartaDOS Pro 3.3 for exclusive use
and distribution with K-Products' BBS Express! Pro, to provide this BBS
system with the most stable platform possible. As Video 61 now owns the
rights to BBS Express! Pro, SpartaDOS Pro 3.3 is therefore now a product of
Video 61.

According to Stephen Carden:
The SpartaDOS Pro 3.3 versions were never owned by K-Products, and are
technically shareware owned by FTe, although FTe had no connection with the
specific development of the 3.3 versions.

Apparently, there is a small debate over who owns 3.3.

Reading these old computer groups, I think they are some sort of weird
sexual fetish groups about sex with computers.

So did you ever "attach your cable" to your ATARI ?

> So, the SDX cart stays in and contains all the external utilities, correct?
And I assume you can still load up built-in basic? < Yes.

SDX has a very low LOMEM -- FRE(0) provides 32395 with SDX and 8K BASIC,
versus 31781 with MyDos 4.50. But SDX does not work with Turbo Basic XL (which
gives 34021 bytes free with MyDos).

I also didn't realize/remember that 3.3c was a "pull the cart" product.

I can give you the plans and layout for a double-sided Cartridge that will take a 27C64 (8K EPROM) or a 27C128 (16K EPROM) which plugs directly into the port and acts like any standard game cartridge. The EPROMS are best bought on ebay (approx. $1 per EPROM) , most Electronics shops dont stock them anymore. You´ll need to etch the board yourself (or get someone else to do it for you). The other components (a bit of logic and a capacitor) are easily available. As far as Burning ROMs, I´d recommend the Willemorg programmer http://www.willem.org/ , which you can either buy as a kit for 37 euros or built and tested for 65 Euros. The software required can be downloaded from their site.

I'd sure love to know what magic the 3.3c cart does to get 39967! You
suppose that's a bogus report, or perhaps it's doing something funny with
my extra memory? Perhaps I should try it in my unmodded 800 to see what
happens.

I can also try the cart with Turbo Basic XL tonight and see if it works.
When you say it doesn't work with SDX, does that make itself apparent when
you load TB?

328. SIO switch box?

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-19 17:33:43 UTC
From: Slor <slor@comcast.net>
Message-ID: <Xns95E37FC9C270emuslor@130.133.1.4>
Source record: 13233

Is there such thing out there as a switch box for SIO devices? Think of the old serial and parallel A/B switches for PC - I'd like to have something similar for my 8-bits so that I could share a chain of SIO devices (especially disk drives and the APE interface) among multiple computers, switching back and forth without having to continuously hook and rehook. Ideally, it would handle up to 4 devices. I suppose I could just share the APE machine with a DB9 switch if I wanted to make/buy more SIO2PC cables...

Anyway, I'm probably going to pick up a cheap DB25 switch to share my MSS100 between my PC and Atari, and that got me thinking how nice it would be to do something similar among the 8-bit devices as well.

Thanks!

With the Deluxe Quintopus, you can share the devices with 2 computers:

http://www.nleaudio.com/css/products/quintopus.htm

You could probably build something like this fairly easily and expand
the number of switched ports to as many as you need. On the one I have,
the switchs are DPDT toggles that appear to just switch in or out the
Motor Control (pin 8) and + 5 VDC/Ready (pin 10) of the SIO connection
for the devices on the switched ports.

The Multiplexer supposedly handles up to 8 computers but requires you to
modify the computers:

http://www.nleaudio.com/css/products/multiplexer.htm

The MPP/Supra Micronet allows you to share one SIO chain among up to 8
computers, but does nothing to control the access, so if more than one
computer tries to access SIO at the same time bad things can happen.

http://www.atarimagazines.com/v4n10/productreviews.html

I have one of these also, but I've never gotten around to actually
trying it out.

Just having that association pop in your head means you are one sick
puppy..

You also assume all retro fans are male.

Some of us actually grew up in this 8-bit era, so it has qute a lot of
meaning to many us.

> When you say it doesn't work with SDX, does that make itself apparent when
you load TB? <

Yes, it aborts the load and returns to the D1: prompt. It might be possible to
configure SDX to work with TB -- IIRC, SDX can work with an 800, so it would
not use the OSRAM. (But I've never tried it.)

> I'd sure love to know what magic the 3.3c cart does to get 39967! <

So would I! ;-) You get that with 8K BASIC and 3.3c and a FRE(0) function?
What happens if you press RESET and then do a FRE(0)?

It is possible to put a large chunk of Dos code under the OS or into expanded
memory (XL/XE), but still the OS and drivers use up to Page 6 (which should
still be available for the user) which makes the absolute lowest LOMEM $700
(1792). There would have to be some "stub" of code past $700 and there would
likely have to be work space for the external utilities on the disk. It could
be *possible* (I think) to re-write the externals and execute them from under
the OS, also. But under the best-case scenario, LOMEM would need to be *at
least* $800. So 40960 - 2048 = 38912 which is >1000 bytes less than the 39967.

I inherited an old home made box with three (3) SIO jacks and 7 DPDT switches allowing all 13 lines to connect the center jack to either of the other two. I know it was used for duping cassettes in the early '80s and I would never use it on drives unless the ground pins had permanent connections, which I have not done. It just seems too much like a hot plug electrically.

338. Atari 8-bit Cartridges for Sale

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-20 01:09:29 UTC
From: Steve Sherman <sdsherman@core.com>
Message-ID: <10uu16j5rqv4b2f@corp.supernews.com>
Source record: 13243

I'm not a regular reader of this group, but I have some cartridges for the Atari 8-bit computer series I'd like to sell. Before going, the eBay route, I thought I'd offer them here first. I have the following:

Atari Cartridges:

Centipede
Donkey Kong
Galaxian
Joust
Millipede
Missle Command
Ms. Pac-Man
Pac-Man
Pole Position
Tennis

Parker Brothers Cartridges:

Frogger
Q-Bert

Asking $1.50 each for them plus shipping. Take all and I'll throw in a Basic programming cartridge for free. Check my feedback on eBay, userid "sdsherman", for references.

Thanks,
Steve

Now that I've dug out the Micronet device, I have the urge to try it
out. The only problem is that I don't know what power supply to use.
Either I never got one with it, or it got tossed in the box with all the
others. Unfortunately the Micronet doesn't list it's power requirements
on the case. Does anybody know the correct supply to use?

Now you uttered your view on him, I think he's a nice guy! Not the cheapest place to get stuff, but there's not many still supporting the Atari's, and I admire him for that! And if you hate his ads, just don't read them.

I hate spam, but mostly spam that is not relevant at all. I mean, I get about 300-500 emails a day in periods and out of those, only two or three is actual email with sense. The rest is misspelled (did I mispell or misspell that) goods. I don't mind Ben's ads here!

Now I said mine, next please!

Take Atarian care

I might have a spare, without the PSU. I am not sure if the XEP itself is
different in the US than here in Europe. I believe they are the same, but
could be wrong.

Sorry to hear that Dean! eBay's communication is horrible. Lou Spear did a scam on me a while ago and I tried to contact eBay. Not much help in anything there. eBay is fine as long as nothing goes wrong, but if something goes wrong, it's the most utter crap. I wish they had people answering instead of machines. Thinking beings even, cause the answers you get is not something I would be proud to say I work with!

Good luck

Is it anything like the Atari 2600 game Dodge'Em? That's also quite cool. I remember going around and it was getting so fast after a while!

Indeed. I wanted to test this out on a machine without expanded RAM, but
unfortunately the cartridge is not compatible with my 800.

If you do, then you will likely go to jail (or worse) and deservedly
so. You have just made a public threat of bodily harm against Ben. I
hope you never darken the venue of any such gathering. It's bad
enought that you are here in cyberworld.

Does ICD still exist, and do they (or does anyone) hold the rights to SDX?
If not, and if you're looking for functionality over collecting, perhaps
you could get a flash cart from Steven Tucker and put the image on it.

Built-in BASIC (which I assume is the 8K basic you refer to): I also got
33644 with SD3.2g as well as 33294 with SDPro3.3a and SDX4.22 (the one time
I found the magic touch and it booted into BASIC).

This might not be a good idea afterall. It doesn't seem to want to load
internal BASIC no matter what I try on the boot. Is there some trick with
the SDX cartridges to load BASIC?

With no DOS loaded (just turn the computer on into BASIC), I get 37902 with
FRE(0). If I peek the MEMTOP value with no DOS loaded, I get 39967, so
that would be with MEMLO at $700 and MEMTOP at $9C1F.

It might be useful to get the LOMEM/MEMLO and MEMTOP values with the
SpartaDOS 3.3c cartridge.

MEMTOP:
? peek(741)+peek(742)*256

MEMLO
? peek(743)+peek(744)*256

Very much so. Once you get there, hit R to read, NE for the next group,
and to find the place more quickly, hit J to join a group and once under
that command, do F to find and enter Atari, and you will find like 6 groups
that have the Atari name. (I am partly responsible for that) :)

Once in the group you can read through the messages. RE is to reply, and E
for enter a new message. And if I am wrong, ? for menu. :D

This message written on of course a Atari 800 through the Family-Net BBS...
truth is, if you have a lantronix working or shared APE internet
connection, there is no reason why you can't be here at the Family-Net
posting on the newsgroups with your own Atari. :D

>with the long-distance charges. How would I go about telnetting to BBSes using
> my PC as a gateway with APE and a SIO2PC interface? I saw that APE has the R:
> handler internet modem emulation. What's next? Any software? Thanks!

I have done this all of once. And it worked well. Maybe someone can
better explain, but the basics are a PC connected to the internet already,
and a windows version of APE to take advantage of that. On the Atari side
I had Bobterm running. I think that APE just puts out a simulated R:
driver that tricks most Atari terminal software.

I can remember the Atari world before all the cool stuff Steve Tucker has
done, and yet I don't remember it being this cool. :)

Anyway, that is the basics... a windows PC, windows version of APE, the
APE cable, and a Atari.. and that Win-PC being connected to the internet
already. And I believe it can take advantage of any internet connection...
dialup,DSL, just whatever is connected.

Anyway, hope you get something working as I try to get as many Atari users
out on the Atari BBS's as we can get.

Hey Gork... love the name.

I have had Z-luck with XF551 drives... so far. I have three, all are in
real crappy shape. One is being used to power the hard drive for the MyIde
device.

Best Electronics all I can say is, not bad. If you have money to throw at a
problem, Best is a sure fire solution. That is, money to throw at it, and
don't want to shop around. And in truth, I always think of Best as a good
plan C. When all else fails.... ;)

> --
Five years ago this was a big challenge. Now getting a Atari 8 to do
telnet is becoming standard.

Having tinkered with a ST/TT and 800xldeejay I have to say, I loved the
idea of the virtual drives on a Atari, really great, even thought of it
again tonight to get my TT030 out of retirement. However, APE on a small
PC laptop that can run ATRS and is fairly diverse verses a full blown TT030
a big VGA monitor and is slight less diverse, just doesn't fit the current
mission profile. :D But a neat program.

APE as a network cable? Used slightly in my own messing around. It
involved a serial switchbox, my APE cable, a laplink cable, and I was able
to setup a slight network then. Had some cool side effects. :D

Atari 8's can telnet, check newsgroups and E-mail. Basically they can
telnet using the Win-Ape program, lantronix devices, etc etc... and then
once they reach other services through telnet.. then newsgroups, E-mail,
etc etc. And I could give you a list of Atari BBS's if interested.

Take care!

Doc Clu 800 (Written on a Atari 800... thus the 800 in my name). :)

> what device will be the best? MSS1-T, UDS- 10 or other device. I have a PR
> connection for the serial connection.

> TIA

Always makes me happy to see another person trying to reach the Atari
BBS's. Let me know if I can help. I have a UDS-10... a basic and lesser
cost (??) solution, but not the best as so far it only understands IP
addresses. This is not a problem at all if the IP remains constant, but
many (US) telnet BBS's like Closer to Home (is that one still up) and Boot
Factory (AWESOME!) have changing IP'S.

I have a friend working on setting up a telnet service where you can hit
the service with a IP address, enter the URL, it pings it, and spits out a
IP address and then kicks you off. Designed for UDS-10 users. WE'll see
if this ever happens. :)

I've heard is said that the MSS-100 is the best lantronix device for
calling out, but am not personally a expert. :)

I think M.U.L.E. online is quite cool, which has me wondering, didn't
Atari800Win have a online gaming option a few years back? What would it
take to network real Ataris over telnet for a multiplayer game? Something
action intensive like Archon might not work with current internet speeds,
but what about turn based, like M.U.L.E. and Ultima?

Anyway, thanks Adam for letting us know about this.

>>
>> So did you ever "attach your cable" to your ATARI ?

> Only when playing Strip Poker

LOL Gotta love it.

No Atari 800 game ever made me want to interface with my Atari.

Now the cover art of the blond on the Scott Addams first graphical adventure
(on the box, not the game) now that is a different story.

And I seem to remember some interesting cover art for something like a
Pascal programming book. LOL

Anyway. For the longest time I thought that the Atari 8-bit was not capible
of graphics enough for some "interesting" pictures. Then I ran across some
"interesting" ascii pics, some gifs converted to the Atari, and some koala
pics. Yeh.. amazing what we found so great back then.

Which has me wondering... how did they scan those "interesting" pics in the
koala pictures? Would like to make some interesting pics of my own..
well.. interesting in a different way that is. :D

>> 1) Friendly, honest, helpful and fast with service (24 hours
> turnaround

I'll admit, I got a good laugh from this message. I have never understood people's animousity for Ben Smith. He is a nice guy, keeps a service going for Atari, ect ect.

Then I looked at the name. "FireflyST" The "ST" portion says it all for me. We Atari 8 bit users have been off the power curve so long that we have curved back. If we hear of Atari support we are like "Wow... Atari support... in 2005... wow..." And maybe we'll buy something every now nad then.

ST users are just now leaving the power curve, there is still amble support left in Europe, and here comes this Ben Smith guy pouting about his service when you have dozens of others that don't. And generally it is the ST users that complain about Ben Smith.

Of course ST users complain about a lot of things. LOL!

That is why I stopped reading the ST newsgroup and my TT030 collects dust.

>
> I wish I knew exactly what these programs change in the boot process

Is replying to yourself anything like talking to yourself? Anyway... I formatted two ATR images in SpartaDOS, one using XINIT and one using the new XINIT.551 program. I then disassembled the boot sectors of both images and made note of the differences. I thought maybe I'd be able to figure out what XINIT.551 does differently in the boot sectors to make the XF551 boot properly. Alas, I am so green at this assembler language stuff and couldn't catch on to much, even though there were only a few changes...

I uploaded a zip to alt.binaries.atari containing three Word documents. One is called Changes.doc and contains the changes I noted in the two boot sectors. XF.doc is the first three disassembled sectors of the ATR formatted using XINIT.551 and nonXF.doc is the disassmbled first three sectors of an ATR formatted using the normal XINIT command. If anyone wants to take a look, there they be...

From a previous post in this same thread:

"Matthias Reichl" <usenet-200501@hias.horus.com> wrote in message news:slrncuctns.1jb.usenet-200501@camel.hias.horus.com...
> If the disk won't boot with your XF551 it could also have to do with
> the boot code in the first 3 sectors. The XF551 won't set the density
> correctly unless you read sector number 4.

I have been thinking about what you said here and wonder if maybe this is what XINIT.551 changes? I wonder if it could be forcing the reading of sector 4 during the boot process in order to properly set the density in the XF551. Perhaps when XINIT is used in SpartaDOS it normally skips over sector 4 in the boot process or something. Boy oh BOY am I throwing out a lot of conjecture here!

I still wonder, though, if formatting a disk with XINIT.551 might render it useless on another DSDD floppy drive... "XF551 weirdness" you say... I'm starting to see where you're coming from!

I used to be some ten messages or something in here. Now it's looking really alive. I love that, but is there any particular reason this group suddenly was springing back to life?

I was therefore hoping more people was getting into the machine again and that there might be more programmers out there who might be interested in doing some new games, applications or whatnot.

That would be cool, cause I miss all the old technique swappings, small demos and everything from the old days! Hi, Nir Darey, Frankenstein (any Megamagazine issue after #7) and all the others from the past. Not sure if anybody still use/program on the machine, but would be nice to see a comeback from a lot of those people! Talented guys!

Take Atarian care

371. DGS Atari 8-bit CD compilations - banned by eBay!

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-20 14:59:55 UTC

Source record: 13126

I think Dean's experience of ebay's attitude to it's customers isn't a one off, i find ebay's attitude towards people selling software on there internet auction service strange, especially in relation to dean's experience as, although i haven't bought or sold anything from or on ebay (and i wouldn't want to in a million years from what i've heard), i have seen people selling emulation software (incl, emulator, o's roms and software images), and even quite a few people selling MAME (both the emulator and accompanying rom images)and, all this i have seen within the last 2 or 3 weeks, doesn't that fall into the same catagory as dean's software collection... or am i, like those that 'supposedly' run/manage EBAY an absolute twat who knows sweet F A (and no, that's not football association or fanny adams)

And because EBAY don't understand the difference between copyrighted software or/and PD software, I suppose that i wont be seeing adverts from Atari users selling their original APX (atari program exchange) collections, and also collections from the various ST and 8bit PD libraries incl Page 6 (all this, i have seen on their website within the last month) what the heck, they even had ad's from amiga users selling Aminet and cloanto PD software (and this was two weeks ago) and if you really need to understand ebay's policy on selling software on their website, I've even seen some ad's form Atari, Amiga and PC users selling the infamous Sega/nintendo cartridge copiers (both h/w and software versions)

Perhaps EBAY can clear this one up,that Dean isn't allowed to sell his software collections on ebay, but people offering h/w and software allowing you to copy copyright rom cartridges are allowed to sell these items on ebay

But there again, as i was always told, the bigger the company gets, the more it looses touch with it's customers, after all EBAY is more interested in share holders and the shareprice/stocklisting and not so interested in their customers

And going by what I'd heard recently about EBAY, especially from the BBC program WATCHDOG

It would appear that the name EBAY is more closely associated with being ripped off, SCAMS on a Massive scale, and lastly FRAUD

Or to put it another way, EBAY has now become a byword for FRAUD, RIP OFFS, AND SCAMS ON A MASSIVE SCALE

Perhaps we should all boycott ebay, and perhaps they might change their attitude toward their customers

```
end of pitch
```

Hi, Ed.
I found a free FTP program, called 'FTP Commander'. It is very competent
and solves the problem of filenames scrolling off the screen. But I was
actually hoping for a DOS command line program. It is a legacy of my 8-bit
that I am most comfortable with a command line program. The GUI stuff just
doesn't seem to satisfy. The Polish site works fine, actually, with just
the FTP that Internet Explorer has, and ftp. And spudster isn't working.

One of these days... I've been writing software for many years, but I have
never done anything of any worth for the Ataris. Spent a good amount of
time a while back acquiring all the tools, books, etc., but still have not
really gotten myself into the coding. Would sure like to!

> (8:8/2)

Kaillera was implemented into Atari800WinPlus in November of 2002.
However, I did not discover this until September of 2004. I was very
motivated by this to recruit MULE fans from all over to join me. I had
noticed that some other M.U.L.E. fans had attempted to play online
unsuccessfully, and I was determined to get it working. I am glad to say
that I succeeded.

I don't think Archon would pose a problem with current internet speeds.
Most people these days have broadband, and that is sufficient enough to
play Arcade games using Kaillera and MAME emulator. I am sure an old 8-Bit
game like Archon doesn't require nearly as much bandwidth as let's say
Street Fighter arcade game!

To be honest, I've grown tired of e-mailing them. Every time I just get the same response (word for word), which basically says 'we believe we've taken the appropriate action'. I've asked to thrash it out with their legal people, but they won't even respond to that one.

I also raised the point that they'd have to remove thousands of other listings if they didn't allow PD software to be sold, but they didn't seem to care less about that either.

Hey Viard.

Um, I've not been paying attention to many threads, but definitely keeping
my eye on Atari networking and USB cartridge posts. ;^)

> I was therefore hoping more people was getting into the machine again and

I still want someone to do Galaga, based on my SuperIRG graphics idea. ;^)

Hi
I received a lot of Atari equipment recently. I need to know which Atari
equipments go with the following power adapters. Any help is appreciated:

P/N C017945
P/N C018187
P/N C061982
P/N C061982
P/N C06163 (THE LAST DIGIT IS NOT VISIBLE BUT IT MAY BE A 6 OT 0 OR 8)

THANKS
STEWART

I believe I found our culprit, or at least shown that the numbers
reported are a bit bogus... Here are the scenarios I'm seeing:

- If I boot without holding the Option key and then load Assembler
Editor, the SIZE command gives me 0000 0000 9C1F.
- If I boot without holding the Option key, do a BASIC ON and then a
CAR, the FRE(0) yields 33294 (not bad), and the peeks above yield 39967
and 6400 respectively.
- If I boot holding the Option key to send me straight into BASIC, FRE
(0) yields 39967, the peeks are successful individually but adding the
math to the statements cause the system to lock up. Trying to access a
memory location that isn't actually free, I'd guess.

So, I guess the bottom line is that this cart does something strange
resulting in an improperly reported free memory area, and doing a BASIC
ON after boot is enough to correct it. What do you guys think?

Have you looked at the boot sectors AFTER the dupdisk process onto the
Xinit.551 disk?

Theoretically, a sector copy should duplicate ALL sectors including the boot
area..?

```
Good point... I haven't actually looked at a disassembly of the first three
sectors of a disk copied via DUPDSK, but my past experiences seem to
indicate that you are correct. If I use XINIT to format a DSDD ATR image
and use DUPDSK to copy the ATR image to a floppy in the XF551 the floppy
will not boot. But if I use XINIT.551 to format a a DSDD ATR image and use
DUPDSK to copy it to a floppy in the XF551 the floppy boots just fine.

Well, I haven't used BEST before, but they were fast in response and I wouldn't mind dealing with them. They're the only place I've found NEW XF551s advertised, so I've considered getting one from them, should I decide to get a second one and feel like flushing $200...

I guess I lucked out with my current XF551... I bought it on eBay a month or so ago with a 130XE and various software for about $110, as I recall. It seems to work perfectly. Well, apparently, as "perfectly" as any unmodified XF551 will work... :) I haven't seen another XF551 on eBay since...

It does the same thing to me. I think it has something to do with the way
the Maxflash cart is controlled versus the way the SpartaDOS X cart is
controlled, but that's just a guess.

One way to get the complete file listing with the ftp command is to
use 'ls . files.txt' or 'dir . files.txt' and then examine the file
'files.txt' after you get out of ftp (or even before you get out of
ftp if you open another dos window or use notepad). You can also
specify an asterisk instead of the dot, or wildcards like at* instead
of the dot to get a partial listing.

395. Video control on Atari 800?

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-21 17:55:02 UTC
From: Slor <slor@comcast.net>
Message-ID: <Xns95E58366B42AEemuslor@130.133.1.4>
Source record: 13050

Hey guys - Is there any video control on the 800 similar to the pots on other models? I just hooked mine up via s-video, and the picture is sharp but a bit too bright and washed out. Conversely, if I hook it up via AV, it's very dark. I figured I'd see if I'm missing anything obvious before I go home and open it up to look for an internal adjustment...

Thanks

The eccentricities of the 551 must be detecting some property of the format;
I have heard they reject media w/o a timing hole even though using a soft
sectored environment. Timing hole can not explain your situation since
reading drive and formatting drive are the same.

Maybe it is sector skew layout or related to sides or density... Any
difficulty booting SSDD or SSSD media in this drive?

> SuperIRG is working and see if I can give it a try?

SuperIRG is just a regular IRG mode text display (e.g., 40x24 with 4-colored text), except the character set changes every VBI. (There are no DLIs necessary, and no color palette changes.)

Upon choosing the right 'primary' colors (the color palette that the pixels in the characters will be made up of...), you can then blend most of them to create new colors.

For example, if you have Red, Yellow, Blue and Black for the colors (for now, we'll ignore the special '5th' color that IRG mode provides), you can end up with:

Black [Black & Black]
Red [Red & Red]
Yellow [Yellow & Yellow]
Blue [Blue & Blue]
Dark Red [Red & Black]
Dark Yellow [Yellow & Black]
Dark Blue [Blue & Black]
Orange [Red & Yellow]
Green [Blue & Yellow]
Purple [Red & Blue]

Since there are no color palette changes, you can create checkerboard patterns to reduce the distraction from flickering between two colors. (In APAC and ColorView modes, you end up with horizontal slices with dark spots between lines, sometimes.)

For example, a nicer patch of dark red would be:

RbRbRb bRbRbR
bRbRbR RbRbRb
RbRbRb bRbRbR

versus:

RRRRRR bbbbbb
bbbbbb RRRRRR
RRRRRR bbbbbb

[Where "R" = red, and "b" = black]

> Would need help on a few
> things, like the attack waves, graphics design (I think I can make it move
> smooth, but not draw it) Any body else fancy a go in a partnership?

Check out:

http://www.newbreedsoftware.com/lab/atari-galaga/

For SIFE, my Super IRG Font Editor for the Atari, see:

http://www.newbreedsoftware.com/sife/

My one SuperIRG-based game, so far was "Gem Drop" from a few years back:

http://www.newbreedsoftware.com/gemdrop/

Both of those were written in Action!

ONE of these days, I'm going to create a C program (or something) for Linux
that can pick the best Atari colors to generate particular colors via
Super IRG blending, and another C program (or something) that can convert
an arbitrary image (e.g., a PNG or GIF) into a Super IRG font...

Hi Carsten.

I heard that USB is a significant load on the CPU (even a slow Pentium).

Since a 6502 is about <1% of a Pentium, and manages to talk to USB, then I guess this is not true for low-data rate peripherals at least.

Would I be right to think that it only get to be a problem with high data rate peripherals (like disks), or clumsy OS software (like Win95!)?

Are we likely to see USB disk drives for the Atari?

Although these may never have the full data rate one can get with a PC, they may be much faster than the Atari serial bus.

404. WD1772's available Info. back! (fwd)

Subject: WD1772's available Info. back!

Thank you for your E-Mail dated 1-20-05 Robert.

Q. Do you have WD1772's available for sale? I need three.

A. Yes, we have the standard WD1772 I.C's in stock and also the Upgraded
backwards compatible Atari Ajax I.C. (the upgrade current replacement for the
WD1772) which can do both standard density and HD Density floppy formats.

No at all. It depends on the USB Controller used and the Driver. On some
Systems, it might be slow.

We are using a more intelligent USB Controller, not a dump one where the
CPU has all the work.

The XF551 will READ media that has been formatted with a drive like the 1050
which doesn't use the timing hole, but it will not WRITE to media which
doesn't have a timing hole.

And nope... No problems booting SSDD or SSSD media. Additionally, this is
only a SpartaDOS phenomenon. If I format a DSDD disk with MyDOS and write
DOS/DUP it boots just fine...

You know, I tried to upload the disassembled sector information to the
binaries newsgroup but it doesn't appear it has posted. You can download
the files, as described previously in this thread, from
www.gorksplace.com/XF551&BootFix.zip. I'll leave the file available for
download for a week or so.

The posts and questions about the possibility of USB drives and existence of the SCSI CD-Rom reader made me wonder about using a Black Box with a SCSI floppy drive. On the surface, it seems like this would be a reasonably easy application -- much easier than a CD-Rom. (Of course, not nearly as easy as plugging in the Floppy Board.) Has anyone ever looked at or heard anything about this?

-Larry

It seems the disassembler got a little bit out of sync (there are quite
some illegal opcodes in the listing). Could you please upload a raw
binary file (384 bytes) containing the contents of sectors 1-3
(one file with the original sectors, one file after XINIT.551).

> I still wonder, though, if formatting a disk with XINIT.551 might render
> it useless on another DSDD floppy drive...

If the changes are only that the new code is reading sector 4, it
will work fine. At least, if you use a sector copier to copy the
disk to another (non-XF551) drive, or if you create an ATR file
of the disk.

Using a DSDD disk created in an XF551 will most certainly not work
in another (non-XF551) DSDD drive. The XF551 uses a very strange method
to write DSDD disks:

First, it writes the sectors 1-720 to side 1 of the floppy. So the
first half of the disk can be acessed in a SS drive without any
problems.

But then, it writes sectors 721-1440 to side 2 in reverse order (!).

So far, I haven't seen any other drive which uses this strategy...

Most other drives either first write to side 1, then to side 2
(in normal order), or - like PC drives - first fill track 1 of side 1,
then track 1 of side 2, then track 2 of side 1, ...

so long,

Hias

To be more precise: The AJAX is a WD1772 compatible chip, but contrary to the original, it is able to work at clock speeds of 16 MHz (HD) and 32 MHz (ED), not just 8 MHz (DD).

This chip is fully supported in all Ataris of the Mega STE and TT range (just replace ist, change the position of one of the internal DIP switches and the desktop enables HD disk formatting), but AFAIK the older ST machines require some additional soldering to supply the AJAX with 16 MHz and some additional software to format HD disks.

HTH,

Thorsten

This is probably to keep compatibility with the single-sided drives (1050,
810) ?

>But then, it writes sectors 721-1440 to side 2 in reverse order (!).

I seem to recall a few people saying this wasn't really in reverse order,
since it is writing to the back side of the disk and that side is spinning
the opposite way that it would be if you were to flip the disk over.
Here's an old message from csa8 about that:

[begin quote]

"This is somewhat misleading to anyone who has no understanding of
double-sided disk drives. From the standpoint of "true" double-sided
operations, the XF551 does NOT write the 2nd side in reverse; flipping
a floppy writes it in "reverse." Flipping floppies has been the
method used by 8-bit Atarians for using the 2nd side of a floppy,
but it is only a standard (sort of) in the Atari world. (Unless
"Commodorians" and/or "Applites" or other single-sided drive users
do this too? I don't know about other 8-bit-computer disk drives.)

If one has an XF551 drive, and wants the 2nd side of a floppy to be
usable in other drives, then the solution is to flip the floppy as if
the drive were a 1050, except that the floppy needs to be punched with
a 2nd set (1 on each side of the jacket) of timing holes (I recall
reading that the XF551 uses those timing holes when formatting
floppies, just as the Percoms do. No, I never got into punching new
holes in my floppies to use the 2nd side in my Percoms, but now that I
know it will work.... maybe I'll try it, carefully!)

They wouldn't be compatible with single-sided drives would they? If you had to support two different methods of writing out sectors to the disk whether or not it was to be single-sided or double-sided that would require more code in the drive itself, I would think.

Well, that's my admittedly uneducated view on it.

I have a UDS-10 connected to an ICD P:R: connection using R1. I can connect fine, but when I try to download files I get bad CRC and the download just times out. Is there something I have missed in the setup of the UDS-10? I'm connecting at 9600 baud, and I've tried different translation modes and download protocols, but I always get the bad CRC.

TIA

If you are using a Telnet connection, realize it isn't "8-bit clean". I wound up using the Lantronix COM port redirector and using a terminal program on the PC side to do the transfers, most of the time to a Host program on the Lantronix end.

Thanks. That makes sense. Another problem I have is that even
though my terminal is set to full duplex, the characters are echoed
on some of the BBSs I'm trying to call. I can't seem to figure that
one out either.

Well, if you are in setup and you hit "9" to save it, the device
self-boots.

Interesting problem. I'd ask for the addresses, but I cannot surf using
my Lantronix anymore. My ISP doesn't support Linux, and Win98 internet
connection sharing doesn't work well with my ISP's dialer - they seem
to fight one another. I usually have to re-install the dialer, and then
some time later ICS just stops working. Usually a protocol or service
required mysteriously disappears. If I reinstall, then my dialer is
hosed again. Viscious cycle, that...

I just use the device to transfer files back and forth these days. A
serial cable would probably be easier, but I don't have any 40-50 foot
serial cables.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hey Vidar! What can we say? It is spring... no wait, it is winter... I dunno... why are things springing back? :D

The USB cart is amazing considering the ST does not have this yet. And the lantronix serial to ethernet adaptors have been a real kick to getting some real hard ware out to visiting the four or five Atari telnet BBS's out there.

I am thinking of getting into developing myself, mainly looking at doing some programming, ATASCII art and all for the Atari BBS scene that is going on right now. But I am getting curious. :D

So jump in, the water's heating up!

Nothing that I know of. I know that a 800 can be hooked up "easily" to a
S-Video port (I've heard it said from Cybernoid that the pins are all
there, just connect A on one end to A on the other... etc etc..)

Anyway, interestng stuff... never had a problem with the 800.. use the same
cable on the 800 that I use on the 800xl.

Whoo hoo!! Let me know if you need any pointers. Currently the sites to
see out thre are..

www.family-bbs.org
206.176.144.201
(E-mail account, Atari newsgroups, telnet out.)

Atari news
216.240.173.22
(Atari chat Tues/Thurs 8 pm CST, Sun 10 am CST...
Log in with Ice-T since it needs ANSI)

And of course the Atari (ATASCII) BBS's... Atari Inside
213.10.217.144/8888

Inside 8-bit BBS (US but static IP)
LOL! Just realized I am in Ice-T and the settings have been macros long
enough in bobterm long enough that I forgot. Will did those up. At this
time there are though... as mentioned Atari Inside, Inside Atari 8-bit, &..

Boot Factory
bfbbs.no-ip.com

Closer to Home (been down lately.. hope that changes) cth.dtdns.net

Mouser BBS (been down the last week)

And Thunderdome, still in experimental stages, to be announced.

Welcome to the BBS's! More listings to come.

Doc Clu 800

I'm pretty green here and tried to do as you asked but didn't get anywhere. I have, however, uploaded a new file to www.gorksplace.com/XF551&BootFix2.zip with some new contents. I disassembled the boot sectors again, this time setting the disassembly to 3000. I included NonXF.txt, XF.txt and Changes.txt which contain the disassembled information and the changes, just like before, but this time in text documents. In trying to include a raw binary of the three sectors I used a Windows hex editor to pull the information from the first three sectors of each disk and ended up with nonXF.hex (the information from the XINIT disk) and XF551.hex (the information from the XINIT.551 disk). I don't think this is what you're asking for, but it's the closest I could figure out?? I also included copies of the two ATR images this time as well... The zip file is actually smaller than it was before now.

> Using a DSDD disk created in an XF551 will most certainly not work
> in another (non-XF551) DSDD drive. The XF551 uses a very strange method
> to write DSDD disks:

Yes, yes... Something obvious I missed. I have also read that the XF551, in double sided mode, writes the reverse side in reverse order - meaning the reverse of the way the disk would have been written on if it had been turned over like a "flippy" and written as a single sided disk...

Anyway, your point is well taken. If I write disks on the XF551 in DSDD mode, they will only work on XF551 drives, so there is no need to even be concerned about whether using XINIT.551 will cause compatibility issues with other drives...

I believe it's rarer than the later version that replaced it. I had one
just like it, but my friends who got Ataris a few months after I did got
the more common smaller units. I don't have exact numbers, though, on how
many of each variety were produced.

FWIW, my unit (which looked like the one up for auction) seemed more
reliable than my friends'. Mine would frequently read tapes that my
friends' units would not read. I don't know if that's a matter of the 410
sub-model or whether mine was just an unusually reliable sample.

436. Re: SpartaDOS 32g & XF551 **an explanation**

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-24 07:39:36 UTC
From: Gork <nokraygienspam@hotmail.com>
Message-ID: <10v99ht1pkbub12@corp.supernews.com>
Source record: 13084

Ok... I have decided that, indeed, replying to oneself is the same thing as talking to oneself. However, posting a reply to one's own posts often renders additonal comments from readers whereas talking to oneself normally renders an empty room. So, here goes.

I was contacted off board by someone who explained exactly what was happening and between examination of his information and running through the process myself I now understand the basics of what XINIT.551 is doing differently than the normal SpartaDOS XINIT command. SpartaDOS just does not play well with the XF551. The biggest problem is not being able to force the XF551 to switch densities. Someone mentioned they wrote a utility to change densities in the XF551... IF ANYONE KNOWS OF A SPARTADOS PROGRAM WHICH WILL CHANGE DENSITIES OF THE XF551 ON THE FLY, do let me know? And, for those who have been following this entire thread: If the solution is something simple like "hold down select and hit reset" I'll just DIE. :)

In order to make a DSDD SpartaDOS disk boot on the XF551 there are only three bytes which need to be changed in the first boot sector, sector one of the disk. The bytes which need to be changed are EE, EF & F0. These bytes need to be changed from 4C, EE, 30 to A0, FF 60.

Now for an explanation. First off I'm going to post some of the information in the file "Changes.txt" which I posted a download link to earlier in this thread. This information is best viewed with a fixed-pitch font such as Courier:

```
NonXF:

[001:F0] $30F0 60 RTS
[001:F1] $30F1 A0 40 LDY #$40
```

This information represents the differences between disassembled bytes of sector 1 of two disk images formatted in SpartaDOS. The lines marked "NonXF" were taken from bytes on a disk formatted with the normal SpartaDOS XINIT command. The lines marked "XF" were taken from bytes on a disk formatted with the altered SpartaDOS XINIT.551 command. This command, as noted previously in this thread, formats a disk which allows for a DSDD (or presumably simply a DD as well) bootable SpartaDOS disk to boot properly when the drive is initially in SD mode. Without this change, any attempt to boot the disk in this fashion fails with an error similar to "Error: No DOS."

The above information is divided into three sections. The differences in the first two sections are irrelevant to the process. It was explained to me that the differences in the first section only indicate the volume random number which is supposed to be different on different disks. The second section only changes the message which displays on the screen during a boot error.

The part which does the work is in the third section. You'll notice three bytes are different: bytes EE, EF and F0. This is where we end up in the code upon a "boot error" situation. In the NonXF version, you can see the the command loaded into memory at $30EE is JMP $30EE - this creates an endless loop. As I understand it, this is the reason for one difference

between a bad boot in AtariDOS (at least 2/2.5) and SpartaDOS. AtariDOS scrolls "BOOT ERROR" over and over down the screen until the problem is corrected. SpartaDOS simply gives it's "boot error" message once and stops. And when it stops, it does so because it has reached the endless loop at $30EE.

The three byte change in the code in the XF version indicates the command JMP $30EE command has been replaced with two commands: LDY #$FF and RTS. Here's where my green shows, but basically, the way I understand it, LDY #$FF loads the Y register with the number $FF which indicates an SIO error and the RTS command causes the process to start over and attempt to boot the disk again. If the disk is truly not bootable, as in no DOS present or the like, SpartaDOS will act more like AtariDOS where a "boot error" type of message will scroll down the screen as the computer keeps trying to access the drive.

What does this do for the problem with the XF551 not being able to boot a DD disk when it starts in SD mode? Apparently an error in the boot process is what triggers the XF551 to switch density. So, after a few attempts at booting with a resulting error, the XF551 eventually tries DD and is then able to boot the DD disk.

Another problem which drove me insane through all this though... I did all this using the emulator to create an ATR image which I then wrote out to a physical floppy with the XF551 and APE. (It's much quicker to deal with all the copying, formatting, changing bytes etc with the PC and the emulator as opposed to strictly using the Atari.) I was unable to use the SpartaDOS sector copy command DSKDUP to duplicate the altered ATR image over to the XF551 on numerous occasions. SpartaDOS would give me an error similar to "unable to write boot sector." I *finally* figured out that if the XF551 was in SD mode I was unable to copy the DD ATR image to the XF551, and that is what was causing my grief. (I ended up with this happening on numerous occasions because I booted the 130XE from a SpartaDOS ATR image through APE since it's so much faster. I have my XF551 set as D1:, so I had to turn that off to boot the ATR image. After disabling virtual APE D1: I would turn the XF551 on to enable it as D1: and disable virtual D1: in APE. And upon power on, the XF551 is apparently configured as SD.) The only way I could figure out how to make SpartaDOS set the XF551 to DD mode was to format the floppy as DD. At this point DSKDUP would copy the altered ATR over to the floppy in the XF551 and I was able to verify that the alterations in the three bytes to to the ATR did indeed fix the booting issue. Yea!

Anyway, you can see why I'm interested in finding some way to more quickly set the density on the XF551 from SpartaDOS. I even tried looking for a secotr copier for SpartaDOS which might handle this situation more appropriately, but to no avail. I'm understanding more and more about what people are telling me about the XF551's little quirks and how software must be written to specific "standards" to deal with these issues.

I'm really hoping for lots of questions, rants, comments and additional solutions. And many thanks to my "offline mentor," as well as to everyone

else who has contributed to this fairly lengthy thread!

> up to look for an internal adjustment...

Sadly there is no precise rule about intensity.

For example, I read that video signals are 1V pk-pk, and built a gadget to drive them to that maximum. However, that gave the maximum intensity that the TV could provide, and this is enough to be rather garish. Pixels 'flare' into each other: i.e. bright pixels expand into dark ones. So I set my gadget to drive it to half a volt for normal use, and reserved 1V for when I do want ultra-bright pixels.

Atari video analogue circuitry is not great. It doesn't have a well-regulated power rail, it just uses the noisy 5V logic rail. You can easily improve it a lot by adding a decent capacitor. The components can be modified if you feel confident making mods.

Shawn Jefferson <shawnjefferson@shaw.caREMOVEPLS> writes:

>I seem to recall a few people saying this wasn't really in reverse order,
>since it is writing to the back side of the disk and that side is spinning
>the opposite way that it would be if you were to flip the disk over.

There are two (or even three if you want) separated issues regarding the
"reverse order" incompatibility of the XF551 drive.

The first is the reverse rotational direction of the recording on the back
side. This is just a mechanical issue. When you flip a disk you reverse
the rotation with respect to the disk surface. So any double sided drive
will write the back side in the reverse direction than written when
flipping the disk.

Note that this is not just the reverse order of sector (or bytes). The
actual encoded pulses and flux transitions are recorded in the reverse
order. This makes impossible to read the "flippy" side on a any double
sided drive unless you use a special controller like the Catweasel or the
Discovery Cartridge.

There are further mechanical constrains when trying to read the flippy
side with the second head. The disk doesn't "seat" exactly the same as
when flipped, and both heads are displaced. This makes virtually
impossible such a task even whit a special controller.

A second issue is the order of "logical sectors". This issue doesn't exist
on the PC, or more precisely, it happens at a completely different level.
In a PC and most other systems the order of logical sectors is imposed by
the OS and by the filesystem. This is contrary to what happens in the
Atari. The Atari has a high-level drive working at the logical sector
level. It is then the drive's firmware who determines where, on which
track, side and sector, a specific logical sector is positioned.

I don't know how other double sided Atari drives work, never had one. But
Atari choosed to make the first side of an XF551 double sided disk to be
compatible with a single sided one. This makes some sense, you can boot
such a disk, and read the first half with drives such as US Doubler,
Happy, etc.

Atari also decided to put the first sector of the second side (logical
sector 721) on track 39. Seems a wise decision. Once you decided to make
the first side compatible with older drives, it is better to put
contiguous logical sectors as close as possible. So logical sectors 720
and 721 are in the same cylinder. Otherwise a full stroke seek is needed
when going from sector 720 to 721.

What is perhaps stranger, is the order of logical sectors "inside" a track in the second side. The XF551 starts with the last sector (sector #18) and ends with the first one (sector #1). So logical sector 721 is track 39, sector 18 on the second side. No idea why Atari decided this. Might be an artifact of the conversion routine, might be even a bug.

Lastly, there is the issue of the index hole. Later 5.25 drives, such as most HD ones will not work without detecting the index hole. This is a limitation of the drive mechanism itself. This makes difficult to read a flippy side on a PC drive. Older drives don't have this limitation, and some have a jumper to configure this.

Even when the drive mechanism can operates without the index hole, you still need the index hole to format a disk. Now this is a limitation of the FDC, not of the drive. The FDC will not start the formatting until receiving the index signal pulse. Note that this happens in most FDCs including the one in the 1050. But the 1050 can generate the index signal to the FDC internally.

Sounds like it's the boot code rather than how the destination was formatted
that controls. The really important step seems to be to make certain the
.ATR to be copied was created with the 551 patch. The original format would
only matter if the sector copier does not transfer the boot sectors.

> Anyway, you can see why I'm interested in finding some way to more quickly

Does the XF551 respond properly and reliably to the SIO write configuration
"O" command using the percom block? You could easily do up a quick .COM file
to set DSDD from the command line. All we need is the Sparta memory map to
select an origin for the code; likely around $6000.

btw what language is that? I don't recognize this as 6502 assembly...
Jess

I recall having issues with MyDOS being unable to "force" the XF551 to change densities on the fly. The drive would be "stuck" in one density, and I had to reboot to read a disk of a different density. This sounds like some of the same basic behavior you documented so well.

I never used disk-based SpartaDOS much at all, but SpartaDOS X was my mainstay for years. As I recall, SDX was supposed to be able to force the XF551 to change densities on the fly, unlike all other DOSes which had trouble with this. This was indeed my experience, SpartaDOS X played much better with my XF551 than MYDOS did.

SDX also knows how to utiltize the high-speed mode of the XF551, I liked that too.

So one "solution" might be to try using SpartaDOS X, if you can find a cartridge.

Bob Woolley posted some modifications he had made to the XF551 ROM on here
a while back, as well as a 3.5" modification. One of the modifications
made the XF551 smarter about changing densities. That may be helpful for
you.

Ideally, you want the drive to change densities automatically, not run a
program to change densities.

Exactly! When the boot code is written at the end of the format (if I know what I'm talking about) XINIT writes a "non XF551 compatible" boot sector. When XINIT.551 finishes formatting it writes the XF551 compatible sector. Either way, using the DUPDSK to sector copy an ATR image to a newly formatted disk in the XF551 does indeed overwrite the the boot code with that from the ATR image. (Well, it does if the XF551 is set in the appropriate density - otherwise it errors out. <sigh>)

I'm sorry, this is above my head. I think that you're basically trying to say that there may be a memory location which, when set properly, might cause the XF551 to respond to a density change "request," but I'm not sure. I'm sorry... If I can get somewhere with the "O" command you referred to I'll start working on trying to locate or dump <shiver> a memory map.

> btw what language is that? I don't recognize this as 6502 assembly...

I'm not sure. I must admit I don't know much about what I'm doing here - just trying to learn as I go along... I assumed this was 6502 assembly, but I used a disassembler in a a Windows program called Atari ROM Designer. Maybe I've done something wrong... And here I thought I was breezing along somewhat decently with this stuff!

I noticed several upgrades for the XF551 on the CSS web site, including
those you referred to. I contacted Woolley but he's been very busy. I
appreciate you taking the time, and yes, it would be MUCH better if the
drive would change densities automatically.

I *thought* I was actually successful with MyDOS using the O and P commands from the menu, but I was doing so much during that time I'm not sure. I'll have to try again.

I actually just recently purchased a SpartaDOS X cartridge. I have a manual, but it's sealed and I've been trying to decide if I want to break the seal. I've been trying to find a complete electronic version of the SDX manual online without luck so far.

Thanks for the tip! I'll be looking into this further.

Trying to fix up two Atari 800's right now.

One needs a keyboard that has the crosshair pegs and Springs.
(The whole keyboard on that one)

The other is the type of 800 keyboard with the square slot removable keys.
That keyboard is working fine, but missing...

Escape, 1,2,4,5
W,e,r,p
Cntl, a,s,j
, .

Why were there so many physical varients to the 800? LOL!

From: Christian Keck <christian.keck@ptb.de>
Message-ID: <ct55ab$ne3$1@rzcomm2.rz.tu-bs.de>
Source record: 13005

Hello,

does anyone know the electrical specification of the SIO bus? What
current may a device draw from +5V line? How much current must the
open-collector gate on DATAIN be able to drive? What load may be placed
on the DATAOUT and COMMAND lines by a device?

Thank you in advance,

Christian

Source record: 13009

Received this question from someone who's looking for a game. Here's what he describes of the game:

Hi there. My question concerns not this game, but instead an other. Back in about '84 i borrowed from a neighbor who had a special connect to ATARI (As i [VAGUEly] remember, he had a relative who worked at ATARI.) a game for the ATARI 800XL home-computer system that involved military action in three or four modes of operation: (1) naval, (2) ?terrestrial? (3) aerial/ spatial --involvin' inter-continental ballistic missiles--, ?(4) aerial? (As i've said, my remembrance of that situation is VAGUE.). He told me that it was a RE'ly RARE game, because there had been a big dispute between ATARI and Commodore about that game, involvin' allegation that that game were in effect intellectual property stolen by the one from the other. (Which allegedly stole it i'm not rememb'rin'.) I RE'ly enjoyed meself in playing at that game, but now many years later i can't remember what the title of it is. Have YE any notion what the title of that game is?

Well, anyone have some ideas? Please respond to the newsgroup.

Glenn

Trying to determine the best way to have two active serial ports.. One via a BlackBox and the other via a PR:C. The BB doesnt have any method to address individual serial ports and neither does the PR:C.

So, I assume it has to come down to the RS232 driver being used. If I load the PR:C's rs232 driver, will it be accessible at the same time I'm using the BB?

Just curious..

The SIO commands are utilized with the device control block ($300-30B);
they include "R" for read sector, "W" for write sector, "N" for read drive
configuration and "O" for write configuration. The configuration is IIRC 12
bytes detailing density, drive sides, sector size etc. The question remains,
does the XF551 obey consistently?

hi,
there are scsi floopy controllers to be had. I even have one
manufactured by TEAC. never did hook it up but it really does exist.

Ken

461. Using APE for Pro! Modem

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-25 19:00:12 UTC
From: jamesk@ATxmissionDOT.com
Message-ID: <ct64vshua1@news.xmission.com>
Source record: 13016

What modem init strings does APE want to see to get Pro! BBS to 'answer'
the incoming call?

I've disabled auto answer (in APE) and set ATS0=1 as a modem init string.

Thanks

Anybody out there willing to port basic FTP and Telnet to the 8bit Atari?

If you are, contact me and I may commi$$ion such an undertaking.

Thanks.

Just as a followup.. This would obviously imply either a TCP stack or some other method via APE or the Lantronix devices (although it only supports telnet).

The obvious choice would be to leverage APE and build on some native FTP capability with some kind of APE (through APE) that makes FTP calls.

James King <jamesk@atxmissiondot.com> spit out...:

Ho, Gork.
I once wrote a program to test and change density for a RANA drive. The program would set single, double or 'enhanced' density. I don't remember much about it and I'm not at my archives at the moment to let someone try it. I believe I named it 'SD.COM'. It is on some utilities disks I made. So, it is possible to change density from a program, I just don't remember how at the moment. It may have been SmartDOS/DOS 2/2.5/MyDOS only, I don't remember if it worked for SpartaDOS 3.2d. I'll be back home in about a week and would be glad to let someone try it then.

467. HAVE YOU HEARD THE GOOD NEWS!

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-26 03:10:33 UTC
From: google_groups_web@yahoo.com
Message-ID: <1106709033.007028.300510@f14g2000cwb.googlegroups.com>
Source record: 13022

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

Some people believe that belonging to a local church, temple, mosque or synagogue will get them to Heaven.

Others believe that water baptism, obeying the ten commandments or just being a good person will get them to Heaven.

There are many other beliefs as well, but the good news about God's way to Heaven is found in the Holy Bible.

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins. After Jesus was placed in a tomb He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Bible says, "For the wages of sin is death, but the gift of God is eternal life through Christ Jesus our Lord." (Romans 6:23)

This verse in the Bible says, "For ALL HAVE SINNED, and come short of the glory of God." (Romans 3:23)

This verse says, "But God demonstrates his own love for us in this: While we were still sinners, Christ died for us." (Romans 5:8)

In this passage the Bible clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner.
I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Salvation is not a reward but a gift. The Bible says it this way, "For it is by GRACE you have been SAVED, through FAITH and this not from yourselves, it is the GIFT of God." (Ephesians 2:8)

Nothing in the world is more important than your eternal destiny.

The Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you have not yet made a decision to be saved, please do so now before it is too late. The reason why it is so important to be saved now is because you do not know exactly when you will die. You may die prematurely in a traffic accident, terrorist attack or some other way before you get another chance to be saved.

The Bible tells us that we will spend eternity in Heaven or a place of eternal torment called Hell. It would be terrible to die and go to Hell when all you have to do is accept Jesus Christ as your personal Lord and Saviour.

Some people that have already made Jesus Christ their Lord and Saviour worry about losing their salvation. The Bible teaches Christians that we can never lose our salvation no matter what happens.

The Bible says it this way, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One."

Yes my friend, Jesus Christ is able to save you and keep you saved.

Please tell your family and friends, thanks!

Have a great day!

Now, as much time as I've spent looking through this you'd think I'd have
been able to come up with that explanation. <sigh> Thanks... I really
don't understand how the disassembler comes up with the original code,
though, and Assembly is so new to me I don't recognize the commands.

I was trying to enable telnet through a telnet connection. Telnet
can only be enabled using web setup, so I brought a PC home from the
office and enabled it, then went back to my Falcon and set the rest
up through telnet. The critical setting changes were Flow Control:
01 (some have said 02 is best, but this would not work for me). Port:
23 Connect Mode: 56, Disconnect Mode: C0, Flush Mode: 55. I still
get echoed characters on some BBSs, but downloads now work (on the
BBSs where the echo is correct). Hope this info helps others.

We've unfortunately already found something to worship... it's called Atari... this is the 'new' GOD/Deity on the scene

I think you need to be preaching more to the unconverted (who don't have anything to worship) like CBM/Amiga Users for instance

FWIW, I just formatted a disk on the XF551 using the FORMAT command in SDX, DSDD high speed skew. I then copied SpartaDOS 32g to the disk and used the BOOT command to have the disk boot to the file (X32G.DOS, as I recall). I then removed the SDX cartridge. The XF551 will not properly boot the resulting disk if reset the drive to SD mode (by turning it off then back on).

If I keep the SDX cartridge in, turn the XF551 off and back on then reboot the computer I can access the drive fine from SDX. I don't really think this is related to the BOOTING issue we've been discussing, though, since I have the same result with SD32g.

On a side note, I have been able to verify that if I try to boot from this disk (no SDX cartridge) it doesn't work, as I noted. If I try to boot from the disk a second time by a cold restart of the computer, it then boots with no problem. This seems to coincide with what the author of the program which creates the XINIT.551 program spoke of. It also coincides with the explanation that the XF551 sets itself to DD upon not being able to read via SD.

Anyway, it would seem that perhaps SDX plays better with the XF551 simply due to the fact that it is a cartridge, not necessarily because it has additional code to better deal with the XF551 drive...

I finally cracked the SDX manual and immediately dropped it on the floor, creasing the front cover. <sigh> Oh well! I didn't really buy the cartridge/manual as a collector's item anyway - I bought it to use it.

I do have a link to an online SDX manual (and was advised of the same link offline as well), but it isn't complete.

Anyway, I wasn't able to find anything in the manual which would allow me to change the density setting "on the fly" with SD/X. I mean, no way I could understand, anyway. I see any kind of a simple command or setting which would do it.

I'm going to issue a correction here. I was using a Windows sector editor
designed to view and modify ATR files. This program didn't properly
identify boot sectors 1-3 on the DD disk as single density. The three bytes
which need to be changed are actually bytes 6E, 6F & 70 of sector 2.

Yet another reply to myself... First of all, the SpartaDOS sector copier is called DUPDSK, not DSKDUP. I keep getting it wrong. I also keep typing it wrong on the Atari when I try to use it! Sorry 'bout that...

> ... The only way I could figure out how to make SpartaDOS set the XF551
> to DD mode was to format the floppy as DD.

I at least found that if I simply do a directory of a DD disk the XF551 puts itself in DD mode... That's certainly much quicker than being forced to FORMAT a disk!

I'll have to sit back and wait for someone with more knowledge to help with this one. I've pulled out a few books (SDX manual, Mapping the Atari, XF551 manual, and Inside Atari DOS) to try to understand but to no avail so far.

Additionally, you said something about using a memory map for SpartaDOS, presumably to decide the best place to put code which would force a change in the setup of the XF551 to switch it to DD. I have been unable to locate such a thing - you'd think it'd be in the manual? I'll keep an eye out, though... Running the MEM command after booting to SpartaDOS 32g shows Memlo at $17A2 and Memhi at $BC1F...

477. Atari 800 XL (F) to buy / trade

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-26 12:43:01 UTC
From: Alistair Ross <removemeajross@atxboltdot.net>
Message-ID: <41f7904d$0$26026$fa0fcedb@news.zen.co.uk>
Source record: 13034

Hey everyone.

I've been scouring Ebay UK for quite some time now, and every while an Atari 800 XL pops up for sale. I am a collector of all things retro, and one of my biggest desires is the Atari 800 (see my website: www.aliross.co.uk/museum).

All the ataris that pop up on ebay don't seem to come tested, or with a power supply. I've only ever emulated an 800, so I don't know what PSU it takes, or if any of the ones I have currently would suit it (I have a 2600 and an ST - not that the ST has an external PSU).

So, basically, I wanna buy one. I've been trawling the net but I can't find any for sale apart from Ebay - would you buy one without a PSU? If so, how would I get a UK PSU?

I live in the UK as you have already guessed, and my main reason for posting here is if any of you are willing to part with an Atari 800 I would be really happy to pay you for it.

I would ideally like an 800 XLF (but an XL will be fine), I also want a floppy drive and any carts or disks you want to part with as well.

I do have some other hardware, that I may be willing to part with for a trade or part-trade. For information on these items (all 8-bit with the exception of the ST and my Sun Stations).

So, let me know if you wanna pass on an Atari to a loving home (if you wish to email me personally, just remove the words 'remove', 'at' and 'dot' from my email address).

Kindest Regards,

Alistair Ross

> though, and Assembly is so new to me I don't recognize the commands.

Well, it isn't obvious if you are not familiar with assembler code and
if you just look at the disassembled output.

Most of the assembler code in this part consisted of illegal opcodes
and statements that don't make too much sense. If you know that, you
can guess that this part most certainly is data/text.

A disassembler that doesn't know about the illegal opcodes would just
have showed something like
.BYTE $42
.BYTE $6F
...

Only a few programs really use those illegal opcodes, so in general it
is a good idea to disable illegal opcodes in the disassembler (in
case the disassembler has such an option).

Another disadvantage of using a disassembler with illegal opcodes
enabled is that it can quite easily get out of sync: (almost?) all
values can then be interpreted as a valid statement and it can
take some time until the disassembler gets into sync again.

so long,

Hias
```

Set up a saved search. Fully working/tested 800's turn up regularly, often
boxed.

> I would ideally like an 800 XLF (but an XL will be fine), I also want a

No such thing as an 800XLF. Are you getting confused with STs that used
the F to indicate built in floppy?

I've been using Atari Rom File Designer for these disassemblies. It is becomming apparent that I have much to learn regarding disassembly. What you have said makes perfect sense, though I only understand it on a most basic level.

There is an option in this program to "Use enhanced 65C02 opcodes set." When I disable this option I get a lot more entries of ??? where some of the illegal code was before.

I also tried changing the sector size to $80 from $100 bytes since the first three sectors of a DD disk are, as I understand it, single density. Oh, but whoa does that mess things up! <scratches head>

What I meant to get across was that "it just works." So there would be no need for a command to force the XF to change densities. SDX is able to get the drive to work with any supported disk format/density, and swap among them at any time, without concern on the part of the user. Just how you wish it worked with other DOSes.

CSS is Bob Puff; Bob Woolley is..Bob Woolley. :)

From http://www.nleaudio.com/css/products/XFupdate.htm

The XF Update

The XF Update is a completely new operating system for your XF551 disk drive
that gives you many features you would expect to have had from the beginning.

The operating system for the drive has been completely rewritten so as to
eliminate the problems and incompatibilities associated with the XF551 drive.
The new operating system runs more commercial software, changes density
properly, supports true Ultra Speed data transfer (actually, slightly faster
than the 1050 Ultra Speed), and has an optimized interleave in high speed
formats to produce the fastest possible operation. It is the update every
XF551 owner should have!

Installation requires only a few simple solder connections. The XF Update
sells for only $39.95 plus $5 shipping/handling.

I've got this in the FAQ, hopefully it's accurate:

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF
includes a redesigned motherboard (the XE design) and contains FREDDIE for
memory management and has chroma output. BASIC is Revision C.

Guess you missed my 800 last year, then - I've seen you on the Apple
group ;)

Anyway, if you get an 800, I have a CX85 keypad I grabbed in Canada from
Active Surplus in Toronto (they had a box full of them. If I had space
I'd have bought the lot). I also have, which might be of interest to
you, an XE:VGS system with gun.

It is basically the Atari 800/65XE. If they made an 800XL with internal drive it would be the 800XLD - I think most 800XLs you find in the UK are XLFs, because Atari discounted like mad in the mid 80s after relatively poor sales in the early 80s compared to the US market.

Hello Steve,
the CD`s have arrived fine here in germany. Thank You !!
Now I will spend a lot of time looking at the contents and testing
(downloading/ / copying / playing) all that stuff... greetings,
Andreas.

490. Re: DGS Atari 8-bit CD compilations - banned by eBay!

Hmmm,
very silly behaviour of ebay. just look at all those 5,25" DD disks
being sold at ebay as so-called "empty" or "usable" disks. Most of these
disks are not brand-new nor empty, they just contain old pirated 8Bit
stuff (may it be A8 stuff or Commie stuff or something else)...

maybe one day ebay will close down all 8bit related auction sites
because they are afraid of illegal / pirated stuff... maybe one should
close down microsoft also because their windows is full of illegal (and
surely also pirated) stuff and sources... hehehe -Andreas.

491. Re: 130XE cartridge compatibility?

Newsgroup: comp.sys.atari.8bit

Source record: 13046

Hmmm,
then tell me why a) the Muad Dib demo (by Hurek) or b) the Fast PAcker (by SRU) do not work on XE nor XEGS computers (just two obscure examples). Afaik, they do not check the OS revision... The Muad dib demo for instance starts with a white font on a black background (...Hurek proudly presents Muad Dib...), on the XL OS this works fine - whereas with a XE and XEGS OS you see only garbage here. Then the demo coninues loading and displays a Gr. 15 picture. With the XE or XEGS OS more and more garbage appears on the screen while the demo continues loading and after some seconds the computer system crashes completely... just one example for XE and XEGS OS incompatibility. I have tested hundreds of other programs (games and demos) and there were a lot of them which had problems with the XE and XEGS OS too, but nowadays I do not remember them. As said before, I sold my XE and XEGS some time ago... -Andreas Magenheimer.

Source record: 12897

Well,
they are sold in Germany at ABBUC (www.abbuc.de), just take a look at
their online shop... the items they sell are like brand new (no
yellowing) and if you like to pay a higher p&p you can even get the
XEP80 with original package (otherwise you only get the XEP80 with
software, cables and manual - but not the original package)...
-Andreas Magenheimer.

493. Re: WANTED: SpartaDOS Cartridge

Well,
its nice to hear you have a 256MB Atari - but I doubt that. It is just
that *somehow funny* thinking that almost everything is MB and GB today,
but not the little A8 !! It is still in the kilobytes range... (its
difficult to explain to the kids today, that it is possible to program
something in kilobytes). ;-)Andreas Magenheimer.

Oops. Yeah, stick a K in there. I tend to do that occasionally.

Then again, perhaps I have created the mod to end all mods... :)

Source record: 12901

Well,
afaik TB does not work with Sparta 3.3 (cart and disk) because they both use RAM under the OS. TB does not work with Sparta X cart because of another reason (do not know exactly what it is; it clears the whole memory, throws out almost every driver/handler, switches off any cart, throws out any freezers or monitors, uses its own CIO or SIO routine or in one word: TB takes full control of the computer system when loading it, thus even disabling the sparta X cartridge)... Hopefully someone can explain it better than me...

On the other hand, most programs that use RAM under the OS work ok with Sparta DOS x cart., so it must be another reason than the RAM under the OS issue why TB does not work with Sparta DOS X... -Andreas Magenheimer.

Source record: 12902

Well,
should I give you a tip?!? If you do not mind having "unofficial" cart versions of copyrighted software, you can get a) an Action/Mac-65/Basic-XL/Basic-XE supercart/all-in-one cart. and b) a Sparta-DOS X cart. from Guus Assmann from the Netherlands. He burns them in his spare time and sells them very cheap (since he recycles electronic material, like eproms, pcb`s, etc.). Alas, i do not have his e-mail adress right now, maybe someone else can help ?!? -Andreas Magenheimer.

498. Re: SpartaDOS 32g & XF551 not booting (& reply to Hias)

Source record: 12903

Hmmm,
does this technique of writing the 2nd side in reverse order also have something to do with time/timing ?!? Maybe the drive is faster this way ?!? Otherwise my question is, when the floppy has just read sector 720 where is the read/write head then - at the inner or outer part of the disk ?!? And when it switches to sector 721 (or 1440) where does the read/write head has to move then - to the inner or outer part of the disk ?!?

Meaning, it might be possible that the XF and its read/write head can simply continue the read/write/format process without re-positioning the read/write head, while other floppies may have to set the head back first. but it might be just the other way around... -Andreas.

http://www.FreeMiniMacs.com/?r=14331929

The Mac mini is quite simply the cutest and most adorable young computer you have ever seen. It is a mere 16.51cm wide, 5.08cm high and weighs less than 1.5kg.

It is also the cheapest Apple ever with the basic model at $500 (R3 300). The basic model has a 40gb hard drive, 256mb of Ram, a DVD player and CD Writer drive, a modem, a network port, USB ports, a FireWire port and a port into which you can plug any monitor you like.

It comes with a full suite of software including Apple's OS X 10.3 "Panther" operating system, Appleworks, internet mail and browser, address book and calendar, Quicken 2005, two games and iLife '05, which is a suite of programmes for organising your photo collection, organising and playing your music collection, burning CDs, playing DVDs and recording music.

The minute I saw a picture of the Mac mini I wanted one. I'm a PC user and I can't think why I would want one, but I do, they're that cute.

I reckon Mac mini is going to dramatically improve Apple's share in the PC market.

Mac minis will be available in South Africa from about March at around R4 550.
get your free mac mini:

502. Ramdisk Info...

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-26 20:30:29 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <41F7FDE5.36688892@students.uni-mainz.de>
Source record: 12907

Hello Folks,
here is the new version 3.5 of my RD Info text... (use ASCII or Courier New or something similar for viewing). -Andreas Magenheimer.

Subject 8.10: What kinds of extra RAM and RAMdisks can be installed?
(Version 3.5 from January 2004 by A.M.)

A) Atari 400/800 Ramdisks:

- Size: 64k XRAM (+ 32k RAM)
Banks: 0 thru 3 (total memory = 96k RAM)
Types: Axlon (=Atari) and compatibles;

- Size: 128k XRAM (+ 32k RAM)
Banks: 0 thru 7 (total memory = 160k RAM)
Types: Axlon (= Atari) and compatibles;

- Size: 256k XRAM (+ 32k RAM)
Banks: 0 thru 15 (total memory = 288k RAM)
Types: D. Byrd and other selfmade / Axlon-compatible RDs;

- Size: 512k XRAM (+ 32k RAM)
Banks: 0 thru 31 (total memory = 544k RAM)
Types: selfmade / Axlon-compatible Ramdisks;

- Size: 1024k XRAM (+ 32k RAM)
Banks: 0 thru 63 (total memory = 1056k RAM)
Types: selfmade / Axlon-compatible Ramdisks;

- Size: 2048k XRAM (+ 32k RAM)
Banks: 0 thru 127 (total memory = 2080k RAM)
Types: selfmade / Axlon-compatible Ramdisks;

- Size: 4096k XRAM (+32k RAM)
Banks: 0 thru 255 (total memory = 4128k RAM)
Types: selfmade / Axlon-compatible Ramdisks;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks normally do not homebank when RESET is pressed (a fix should be available somewhere), whereas original Axlon Ramdisks do homebank properly !! (Special thanks to Lee Barnes for this note !!)

B) XL/XE - 64k base RAM plus XRAM:

- Size: 64k (total = 128k RAM, 4 banks)
- Banks: E3, E7, EB, EF (block E = 1 block * 4 banks)
- Types: 130XE-Ramdisk, Turbo-Freezer-XL + 64k, selfmade-ramdisks...

- Size: 128k (total = 192k RAM, 8 banks)
- Banks: A3,A7,AB,AF,E3,E7,EB,EF
(blocks AE = 2 blocks * 4 banks)
- Types: Compyshop 600XL with 192k, Turbo-Freezer-XL + 128k,
selfmade-RDs...

- Size: 256k / 26AE (total = 320k RAM, 16 banks)
- Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF
(blocks 26AE, = 4 blocks * 4 banks)
- Types: Compyshop 800XL RD., Compyshop 130XE RD.,
Peters/David Megaram 1, Peters/David Megaram 2,
Peters/David Megaram 3 with 256k, selfmade RDs...

- Size: 256k / 8ACE (total = 320k RAM, 16 banks)
- Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF
(blocks 8ACE = 4 blocks * 4 banks)
- Types: Newell, Rambo-XL, Scott Peterson, Atari Magazin,
TOMS, selfmade-RDs...

- Size: 512k / 26AE (total = 576k RAM, 32 banks)
- Banks: 21,23,25,27,29,2B,2D,2F,61,63,65,67,69,6B,6D,6F,
A1,A3,A5,A7,A9,AB,AD,AF,E1,E3,E5,E7,E9,EB,ED,EF
(blocks 26AE = 4 blocks * 8 banks)
- Types: none (that I know of) at the moment - but possible!

- Size: 512k / 8ACE (total = 576k RAM, 32 banks)
- Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
(blocks 8ACE = 4 blocks * 8 banks)
- Types: Scott Peterson, TOMS, selfmade-RDs...

- Size: 512k / 02468ACE (total = 576k RAM, 32 banks)
- Banks: 03,07,0B,0F,23,27,2B,2F,43,47,4B,4F,63,67,6B,6F,
83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
(blocks 02468ACE = 8 blocks * 4 banks)
- Types: 1) upgrade / combination of 26AE and 8ACE ramdisk
types to 512k RAM or to *one* 02468ACE ramdisk;
idea by me, built by Bernhard Pahl (see his homepage
at http://www.b-pahl.de/atari8bit/ramdisk)
2) Upgrade of the Rambo XL to 512k by Dan Schmid
(see Pooldisk Too, Subdir ACE/ Acec202a.ATR and
Acec202b.ATR) and of course 3) selfmade ramdisks...

- Size: 1024k / 02468ACE (total = 1088k RAM, 64 banks)
- Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
(blocks 02468ACE = 8 blocks * 8 banks)

- Types: Newell, Scott Peterson, TOMS, Satantronic`s 1MB-
PC-SIMM-RD, selfmade-RDs...

- Size: 1024k / 26AE (total = 1088k RAM, 64 banks)
- Banks: EF,EE,ED,EC,EB,EA,E9,E8,E7,E6,E5,E4,E3,E2,E1,E0
AF,AE,AD,AC,AB,AA,A9,A8,A7,A6,A5,A4,A3,A2,A1,A0
6F,6E,6D,6C,6B,6A,69,68,67,66,65,64,63,62,61,60
2F,2E,2D,2C,2B,2A,29,28,27,26,25,24,23,22,21,20
(blocks 26AE = 4 blocks * 16 banks)
- Types: Mathy van Nisselroy`s 1024k XEGS-PC-SIMM-Upgrade!
(with some changes probably also usable for XL and XE,
see also: http://www.mathy-van-nisselroy.nl)

- Size: 1024k / 8ACE (total = 1088k RAM, 64 banks)
- Banks: EF,EE,ED,EC,EB,EA,E9,E8,E7,E6,E5,E4,E3,E2,E1,E0
CF,CE,CD,CC,CB,CA,C9,C8,C7,C6,C5,C4,C3,C2,C1,C0
AF,AE,AD,AC,AB,AA,A9,A8,A7,A6,A5,A4,A3,A2,A1,A0
8F,8E,8D,8C,8B,8A,89,88,87,86,85,84,83,88,81,80
(blocks 8ACE = 4 blocks * 16 banks)
- Types: none (that I know of) at the moment - but possible!

- Size: 1024k / 0123456789ABCDE (total = 1088k RAM, 64 banks)
- Banks: blocks 0123456789ABCDE each with 4 banks
= 16 blocks * 4 banks (does not make much sense, but...)
- Types: luckily, none at the moment...

- Size: 1024k / ??? (max. memory = 1088k, 64 banks)
- Port-Bits / Control-Bits: $D301 = 2,3,6,7
$D600 = 0,1 (or switches);
- Banks: $D301: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF
$D600: F3,F7,FB,FF...
- Types: David/Peters Megaram 3 with 1024k RAM (and the switches
positioned to 1 x 1024k)

- Size: 2048k / 02468ACE (total = 2112k, 128 banks)
- Banks: 00,01,02,03,04,05,06,07,08,09,0A,0B,0C,0D,0E,0F

F0,F1,F2,F3,F4,F5,F6,F7,F8,F9,FA,FB,FC,FD,FE,FF
(blocks 0123456789ABCDEF = 16 blocks * 16 banks)
- Types: Newell, FTE, selfmade-Ramdisks...

Well, I will not go into details with the disadvantages and
software-problems with ramdisks beyond 512k RAM (Selftest, XL/XE
Basic,
RAM under the OS, separate Antic access, etc.). These problems mostly
occur with 1 Megabyte or bigger ramdisks and there are several hardware
and software solutions for them, alas not working correct with every
software or program. With 4 Megabyte extra RAM / Ramdisk, the PIA is
fully used/adressed, so that normally the base RAM at 4000-7FFF is not
available any longer. But again, there are tricks and solutions to
solve
this problem. Installing a second PIA for example makes it possible to
adress up to 256 Megabytes of extra RAM / Ramdisk - but who needs so
much
RAM on the Atari 8Bit computer ???

C) XL/XE - XRAM minus 64k Base-RAM:

- Size: 192k / 8AE (total = 256k RAM, usable = 12 banks)
- Banks: 83,87,8B,8F,A3,A7,AB,AF,E3,E7,EB,EF
(8AE = 3 blocks * 4 banks)
- Types: older Newell ramdisks (replace 64k by 256k);

- Size: 192k / ACE (total = 256k RAM, usable = 12 banks)
- Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF
(ACE = 3 blocks * 4 banks)
- Types: newer Newell RDs, newer Buchholz-RDs, Rambo-XL,

selfmade Ramdisks (replace 64k by 256k)...

- Size: 448k / 2468ACE (total = 512k, usable = 28 banks)
- Banks: EF,EB,E7,E3,CF,CB,C7,C3,AF,AB,A7,A3,8F,8B,87,83
6F,6B,67,63,4F,4B,47,43,2F,2B,27,23
(2468ACE = 7 blocks * 4 banks)
- Types: selfmade-RDs (replace 64k by 512k)...

- Size: 896k? / 0248ACE (total = 1024k, usable = 56 banks)
- Banks: EF,ED,EB,E9,E7,E5,E3,E1,CF,CD,CB,C9,C7,C5,C3,C1,
AF,AD,AB,A9,A7,A5,A3,A1,8F,8D,8B,89,87,85,83,81,
4F,4D,4B,49,47,45,43,41,2F,2D,2B,29,27,25,23,21,
0F,0D,0B,09,07,05,03,01 (0248ACE = 7 blocks * 8 banks)
- Types: Bob Woolley`s 1200XL 1MB Upgrade, selfmade-RDs
(replace 64k by 1024k)...

Allthough these RAM upgrades are relatively easy to build
(and to install into the computer), they make problems with
quite some software. Some programs tend to use the base RAM
as extra RAM / Ramdisk with these upgrades, which will most
often result in a crash of the computer. Next, most extra RAM
testers will show more extra RAM (or a bigger Ramdisk) than
there is really available (e.g. with a 256k upgrade you will
see 240k extra RAM, but there is only 64k base RAM + 192k
extra RAM). Alas, this is a typical hardware problem for these
upgrades and it cannot be solved or avoided with software...

D) XL/XE: Parallel-Bus-Devices:
(600XL/800XL = Parallel Bus, XE = Cart.-Port + ECI)

- Size: 64k / E (total = 128k RAM, 4 banks)
- Banks: E3,E7,EB,EF (block E = 1 block * 4 banks)
- Types: Turbo-Freezer-XL by Bernhard Engl with 64k XRAM

- Size: 128k / AE (total = 192k RAM, 8 banks)
- Banks: A3,A7,AB,AF,E3,E7,EB,EF (blocks AE = 2 blocks * 4 banks)
- Types: Turbo-Freezer-XL by Bernhard Engl with 128k XRAM

- Size: 256k / 9ABE (total = 320k RAM, 16 banks)
- Banks: 93,97,9B,9F,A3,A7,AB,AF,B3,B7,BB,BF,E3,E7,EB,EF
(blocks 9ABE = 4 blocks * 4 banks)
- Types: Turbo-Freezer-XL by Bernhard Engl with 256k XRAM

- Size: 256k / ??? (total = 320k RAM, 16 banks)
- Banks: unknown !!
- Types: Yorky-XL by Richard Gore / Derek Fern (from
GB/UK) with 256k XRAM

- Size: 256k / ??? (total = 320k RAM, 16 banks)
- Banks: unknown !!
- Types: Multi-Input-Output-Harddisk-Interface (MIO) with 256k
XRAM by ICD

- Size: 1024k / ??? (total = 1088k RAM, 64 banks)
- Banks: unknown !!
- Types: Multi-Input-Output-Harddisk-Interface (MIO) with 1024k
XRAM by ICD

E) XL/XE: RAM/Flash-ROM/... Cartridges:

- Rambox II with 256k RAM by JRC (Czech Republic; with special
Ramdisk drivers for TT-DOS and Bewe-DOS!)
- Ramcart 64k by LK Avalon (Poland)
- Ramcart 128k by LK Avalon (Poland; binaries of the Eprom and GAL
chips of this cart can be found on ABBUC magazine 64)
- Ramcart 256k by Zenon/Dial (Poland)
- Ramcart 512k by Zenon/Dial (Poland)
- Ramcart 1024k by Zenon/Dial (Poland)
(for some hints and pics see: www2.asw.cz/~kubecj/acarts.htm)
- Flash-ROM cart 128k / 1Mbit "Atarimax" by Stephen Tucker
(allthough they are not usable as extra RAM / Ramdisk at the moment,
I am quite sure that it is possible to write some drivers and thus
use the Atarimax Flash-ROM carts as extremely fast floppy drives!)
- Flash-ROM cart 1024k / 8Mbit "Atarimax" by Stephen Tucker
(for information and complete documentation plus software see:
www.atarimax.com/flashcart/documentation/index.html)
- and many others I do not know and I do not have any info about;

Even cartridges can be used as Ramdisks (= fast floppy drives),
especially RAM-carts or Flash-RAM carts. But they function like
most other Super- or Mega-Carts, meaning the bank-switching
techniques are also used there. Since the subject carts and
bank-switching carts is quite enormous, I will not discuss it or
present any information here. Just try to find a large description
by John K. Picken ("RAM/ROM Control on an XL/XE") if interested in that
subject (e.g. at Jindrich Kubec`s homepage: www2.asw.cz/kubecj/...).

Finally thanks and credits for this subject and lots of (used /
borrowed) information therefore go to: Lee Barnes, Russ Gilbert,
Mathy van Nisselroy, Erhard Puetz, Mathias Reichl, Ron Hamilton,
Wes Newell, Guy Ferrante, XI of Satantronic, Bernhard Pahl, Walter
Lojek and Voy/Dial. Also thanks to John K. Picken who wrote an
excellent article about A8 extra RAM / Ramdisks and A8 cartridges and
their technique of bank-switching. Well, if you still find errors, bugs,
mistakes, etc. in this list, then tell me *nicely* or in a friendly
way. Any updates and corrections can be send to: amp@abbuc.de
-Andreas Magenheimer

8.11 What programs support a Ramdisk ?
(This is version 3.5 from January 2005 by A.M.)

The following Atari 8Bit programs support more than 64k RAM, but still
work alright (with multiple loads / disk-swaps) on standard 64k
machines:

a) "TOOLS" that support more than 64k RAM:

A-Base (???, 64k Ramdisk, block E),
Alphasys-Sample Software (Mirage/ANG, 64k XRAM, block E),
A-Text (???, 64k Ramdisk, block E),
Atari Writer 80 (Atari, 64k Ramdisk, block E),
Atari Writer Plus (Atari, 64k Ramdisk, block E),
Basic XE (OSS/ICD/FTE, 64k XRAM, block E),
Bewe-DOS 1.x (Bewesoft, up to 1024k RD, all banks),
Bibo-DOS 5.x (Compyshop, up to 256k RD, E/AE/26AE/8ACE),
Bibo-DOS 6.x (Compyshop, up to 256k RD, E/AE/26AE/8ACE),
Datei 4.x (N. Schlia, up to 256k XRAM, E/AE/26AE),
Desktop Atari (HBSF, 64k Ramdisk, block E),
Diskworker (Petsoft, 64k Ramdisk, block E),
Diskcommunicator 3.x (Robert "Bob" Puff, if there is more than 64k
RAM, answer the startup question with "Y" to use it as XRAM or with "N"
to use it as Ramdisk; up to 256k XRAM: E/AE/ACE/8ACE; RD = DOS
depend.),
DOS 2.5 (Atari, original driver = 64k RD, block E;
other
drivers: up to 2x 128k Ramdisks, E/AE/8ACE),
DOS II+D Version 6.x (S. D., up to 2x 128k RDs,
E/AE/ACE/8ACE/26AE),
DOS XE 1.x (Atari, 64k Ramdisk, block E),

Extended Atari Basic (???, 64k XRAM, block E),
Extended Turbo Basic (???, 64k XRAM, block E),
Fampy 2.3 (Wolfgang Freitag, up to 128k XRAM, E/AE),
Fampy 6.1 (Wolfgang Freitag, up to 128k XRAM, E/AE),
Howfen DOS 3.x (???, up to 128k XRAM, E/AE),
Howfen DOS 4.x (???, up to 128k XRAM, E/AE),
Howfen Tape to Disk (???, up to 128k XRAM, E/AE),
Inertia 2.x (MadTeam, up to 256k XRAM, E/AE/8ACE),
Midi Mate II (Hybrid Arts, 64k XRAM, block E),
Midi Pattern Editor (Raster, 64k XRAM, block E),
Midi Player (I. Kuczek, 64k XRAM, block E),
Midi Recorder (I. Kuczek, 64k XRAM, block E),
Midi Sequencer (M. Sygit, 64k XRAM, block E),
MSC-IDE-Software (M. Belitz + S. Birrmanns, 64k XRAM, block E),
My-DOS 3.x (Wordmark, up to ???k Ramdisk),
My-DOS 4.x (Wordmark, up to 1024k Ramdisk, all banks),
Paperclip II (Batteries Included, 64k XRAM, block E),
Super DOS 2.x (P. Nichols, up to 2x 128k RDs,
E/AE/ACE/8ACE),
Super DOS 5.x (P. Nichols, up to 256k RD,
E/AE/ACE/8ACE/26AE),

The [Sparta DOS] Browser (Tom Hunt, up to 1024k Ramdisk, RD-driver
dep.),
The Sound Utility (Tom Hunt, up to 1024k XRAM?, bug-free only
under
Sparta/Bewe-DOS, one can choose between 64k/128k/256k/576k/1088k RAM,

alas
all setups with more than 64k RAM produced some strange sound noises on
my 576k XL when playing waves or samples...),
Theta Music Composer 2.x (Jaskier, 64k XRAM, block E),
Turbo DOS 1.x (Reitershan, up to 256k RD,
E/AE/ACE/8ACE/26AE),
Turbo-DOS 2.x (Reitershan, up to 256k RD,
E/AE/ACE/8ACE/26AE),
Top-DOS 1.x (R.K. Bennett, 64k Ramdisk, block E),
Top DOS Plus (R.K. Bennett, up to ???k Ramdisk),
Top DOS Prof. (R.K. Bennett, up to ???k Ramdisk),
Typesetter (XLent, 64k XRAM, block E),
X-DOS 2.x (S. D., up to 256k RD, E/AE/ACE/8ACE/26AE),
X-RAM 0.21 (Satantronic, tests up to 4 MB!, all banks!)
and most Text-Editors (e.g. Speedscript, Antic Writer, T-Edit, Page 6
Writer, Compyshop Editor,
Textpro, etc.) as long as they are running under a DOS 2.x (meaning a
DOS 2
derivative) or Sparta / Bewe DOS and the appropriate Ramdisk driver...;

b) "Games" that support more than 64k RAM:

Adalmar (Falk Buettner, 64k Ramdisk, block E),
A.R. The Dungeon (Philipp Price, 64k XRAM, block E),
Bop N'Wrestle (Mindscape, 64k XRAM, block E),
The Brundles (KE-Soft, up to 256k XRAM, E/AE/26AE),
Human Torch & the Thing (Questprobe, 64k XRAM, block E),
Megablast 1 (Thorsten Karwoth, 64k XRAM, block E),
Mental Age (???, 64k XRAM, block E),
[The Amazing] Spiderman (Questprobe, 64k XRAM, block E);

c) "Demos" that support more than 64k RAM:

ABBUC Magazine Intro 52 (Heaven, 64k XRAM, block E),
ABBUC Magazine Intro 55 (Heaven, 64k XRAM, block E),
Anime 4ever (Sente Software Group, 256k XRAM, 8ACE),
Grafik + Sound Demo (Peter Sabath, 64k XRAM, block E),
I. K. Plus Demo (???, 64k XRAM, block E),
Sweet Fantasy (Tight, 64k XRAM, block E),
The Top 3 Demo (WFMH, "Veronika Part", 64k XRAM, block E);

Thanks and credits for this subject go to: Bernhard Pahl, Russ Gilbert,
Ron Hamilton and Mathy van Nisselroy for sharing some information with
me.
- Andreas Magenheimer

8.12 What programs require extra Ram or a Ramdisk ?
(This is version 3.5 from January 2005 by A.M.)

The following Atari 8Bit programs require more than 64k RAM, and thus
do not work at all (or not alright/bug-free) on standard 64k machines:

a) "Tools" that require more than 64k RAM:

128k Memory Testers (quite many programs, 64k XRAM, block E),
130XE Bank/Mem.-Testers (quite many programs, 64k XRAM, block E),
130XE Sectorcopiers (quite many programs, 64k XRAM, block E),
130XE Utilities (HAPS PD 0031, 64k XRAM, block E),
192k Memory Testers (some PD programs, 128k XRAM, blocks AE),
256k Memory Testers (Newell, ICD, etc., 192k XRAM, blocks ACE),
320k Mem. Testers 8ACE (Atari Mag., TOMS, etc., 256k XRAM, blocks
8ACE),
320k Mem. Testers 26AE (Compyshop, etc., 256k XRAM, blocks 26AE),
576k Memory Testers (Peterson, TOMS, etc., 512k XRAM, blocks
8ACE),
1088k Memory Testers (Newell, TOMS, etc., 1MB XRAM, blocks
02468ACE),
4160k Memory Tester (Newell, 4MB XRAM, blocks 0123456789ABCDEF),
APC Archiver 1.x (LBS/APC, 256k XRAM, 8ACE only!),
APC Packer 1.x (LBS/APC, 256k XRAM, 8ACE only!),
A. W. P. Super Menu (Ken Siders, min. 64k XRAM, block E),
A. W. P. XE Super Menu (Ken Siders, min. 192k XRAM, blocks ACE),
Audio/Studio Master (Mirage/ANG, 256k XRAM, 26AE only?),
Boot Majster (Electron, 64k XRAM, block E),
Boss X [Vers. 10.x] (M. Sobe, with any DOS min. 64k Ramdisk, block
E;
with MyDOS 4.x it supports up to 1MB RD, subdirs and up to 16MB HD
part.),

Boss XE [Vers. 8.x] (M. Sobe, with any DOS min. 64k Ramdisk, block
E;
with Turbo-DOS or MyDOS 4.5x it supports bigger Ramdisks, but no
subdirs!),
CAD XE (HAPS PD 0350, 64k XRAM, block E),
Diskettenverwaltung XE (ABBUC PD 86, 64k XRAM, block E),
Draw XE (ABBUC PD 387, 64k XRAM, block E),
Dream Vision (ABBUC PD 480, 192k XRAM, blocks ACE?),
Fraktale & Colorprint (P. Woetzel, 64k XRAM, block E),
Grafik Zeilen Editor (HAPS PD 0296, 64k XRAM, block E),
Hires Dump (ABBUC PD 113, 64k XRAM, block E),
Inertia 3.x (MadTeam, min. 64k XRAM, block E; supports up
to
256k XRAM, AE/ACE/26AE/8ACE with almost any
DOS),
Inertia 4.x (MadTeam, min. 64k XRAM, block E; supports up
to
1024k XRAM - all possible bank
combinations!),
Macro Assembler XE (T. Karwoth, 64k XRAM, block E),
Macro Assembler XE+ (T. Karwoth, min. 64k XRAM, block E; supports
up
to 1024k XRAM - all possible bank
combinations!),
Masher XE (???, min. 64k XRAM, block E; supports up to

256k XRAM: AE/ACE/8ACE),
Menu 130 (Les Howarth, 64k XRAM, block E),

Midi Mate III (Hybrid Arts, 64k XRAM, block E),
Monitors, Debuggers, ... (HAPS PD 0109, 64k XRAM, block E),
Multi DOS 130 (Kuchera/Excellent, 64k XRAM, block E),
Multi DOS 320 (Kuchera/Excellent, 256k XRAM, 8ACE only!),
Multi Tasking OS (???, min. 64k XRAM, block E),
MTOS 256 (Tom Hunt, 192k XRAM, blocks ACE),
MTOS XE (Tom Hunt, 64k XRAM, block E),
Neo-Tracker 1.x (Epi, min. 64k XRAM, block E; under MyDOS 4.5x
or Sparta DOS X cart. it supports up to 1MB XRAM, all bank
combinations!)
Newspaper Editor (HAPS PD 0294, 64k XRAM, block E),
Protracker 1.5 (MadTeam, min. 64k XRAM, block E; supports up
to
256k XRAM: AE/ACE/8ACE/26AE),
Rechnen fuer Kinder (ABBUC PD 85, 64k XRAM, block E),
Rund um die Ramdisk (ABBUC PD 383, HAPS PD 1084, contains info
texts
and pgms. for upgrading the 800 or XL/XE and testing its XRAM up to 1
MB;
the docs use english language and provide detailed information for
Axlon
compatible 800 XRAM and Newell/Buchholz/Peterson compatible XL/XE
XRAM),
Sample Art XE (Mozart/WSL, min. 64k XRAM, block E; supports
up
to 1024k XRAM, all bank combinations, alas the program is
faulty/buggy!),

Shrink XE (P. Fitzsimmons, 64k XRAM, block E),
Snapshot (???, 64k XRAM, block E),
Tape Ramdisk Drivers (Pokey, SAG, etc., 64k XRAM, block E),
Text 130 (B. Russmann, 64k XRAM, block E),
Textpro "+" [e.g. 4.54+] (Ronnie Riche, 64k XRAM, block E),
Textpro 5.x (Ronnie Riche, 64k XRAM, block E),
The Code Cruncher 2.x (Soused Teat, min. 64k XRAM, block E),
The Code Cruncher 3.x (Soused Teat, min. 64k XRAM, block E),
The Cruncher 5.x (MSL/Magnus, min. 64k XRAM, block E),
The Small Printery (W. Lojek, min. 64k XRAM, block E; supports up
to 1024k XRAM, all bank combinations!),
The [Sparta DOS] Wedge (Ed Bachmann, 64k XRAM, block E, sep. Antic!),
The Works (Tom Hunt, min. 64k XRAM, block E),
Wuerttemberger Disk (ABBUC PD 361, HAPS PD 1050, 64k XRAM, block
E;
mainly/only because side 2 contains the XE version of Gizmo's castle),
XL-2 (J.K. Picken, min. 64k XRAM, block E; under
MyDOS
or Sparta DOS it supports up to 1024k XRAM
!),

Zeitungsredakteur (ABBUC PD 121, 64k XRAM, block E);

b) "Games" that require more than 64k RAM:

Castle of Blackthorne (T. Graef, 64k RD, block E),
Cavepack XE (XE-version by K. Ezcan, 64k RD, block E),
Computer Baseball (D. Blackwell, 64k XRAM, block E),
Der Neffe (XE-version by ???, 64k XRAM, block E),
Gizmo's Castle (XE-version by M. Kugler, 64k XRAM, block E),
Kaiser II (128k version by C. S., 64k XRAM, block E),
Kaiser II (320k version by C. S., 256k XRAM, 26AE &
8ACE),
Minesweeper 1-4 (4 versions by J.R. Chicko, 64k XRAM, block
E),
Mister X (S. Soelbrandt, 64k RD, block E),
Oelbaron (XE-version by ???, 64k RD, block E),
Space Harrier (C. Hutt, 64k XRAM, block E),
Strategy Baseball (HAPS PD 0302, 64k XRAM, block E),
Yie Ar Kung Fu (???, 256k XRAM, blocks ??? - This game is a
real
shame [Such a Shame, Talk Talk], since it does not work on a real Atari
computer! Maybe it works on an emulator, maybe it does not work at all
?),
Zargon XE (ABBUC PD 611, HAPS PD 0485, 64k XRAM, block
E),

Please note, that hackers, crackers and pirates also made file versions
of (most of) the XE / XEGS 64k and 128k carts available. Due to cart.
bankswitching, a 64k XL/XE was enough for these super-carts; not so with
the file versions, they do (mostly) require more than 64k memory...
Next, there are also "un-official" (pirated, hacked, cracked, patched)
cart. versions of former disk-based games, that require XRAM, which
they
originally did not (example: Conan, the multi-stage disk-version by
Datasoft requires 64k RAM, whereas the single-stage version of the
Sunmark multicart. req. 128k RAM). Since Sunmark will continue producing
A8 carts and other programable / flashable carts (like the Atarimax
Flash
cart. by Steven Tucker) are on the market today, it is quite likely,
that
more games will occur in the Atari scene with the same behaviour...

c) "Demos" that require more than 64k RAM:

130XE Artshow (HAPS PD 0013, 64k XRAM, block E),
130XE Autoshow (HAPS PD 0637, ABBUC PD 191, 64k XRAM, block
E),
130XE Demo (S.A.G., 64k XRAM, block E),
130XE Impossible Demo (R. Haegemann, 64k XRAM, block E),
3D Scroll (Jaskier/TQA, 64k XRAM, block E),
American Natives (Fox-1, 192k RD, Ramdisk = DOS dependant),
Amiga Boink XE (B. Armour, 64k XRAM, block E),

Animkom. meet B. V. (Animkomials + B.V., 64k XRAM, block E),
(The) Asskicker (Shadows, 64k XRAM, block E; hold Select!),
Back to Life 2 (Jaskier/TQA, 256k XRAM, auto-setup!),
Base 33 (AIDS, 256k XRAM, hold SHIFT for setup!),
Bill Pie Demo (MadTeam, min. 64k XRAM, block E; supports up
to 256k XRAM: AE/8ACE with more frames),
BMW Animation (Mirko Sobe, 64k XRAM, block E),
Brull (Pin/Trs, 1MB XRAM for a sample demo),
CES XE Demo (full 580 sectors version by XANTH, 64k XRAM,
block E; includes the Swan-, Fuji-Boink- and Robot-Demo all in one
file!),
Cogito Demo (AIDS, uses blocks 8C, thus 8ACE only!),
Critical Sounddemo (Innovative, 64k XRAM, block E),
Danielle (Gr.9) Ani (B. Kendrick, 64k XRAM, block E),

DoXEpin (AIDS, 64k XRAM, block E),
Edelweiss Demo (A.R.+C.S.S.+S.V.L., 256k XRAM, 26AE only!),
Ergo Bibamus (Quasimodos, 64k XRAM, block E),
Extract Slideshow (Replay/Bit Busters, 64k XRAM, block E),
Fat Bottomed Girls (???, 64k XRAM block E for a Queen sample),
Forever 1ktro (New Generation, 64k XRAM block E for a 1k
demo),
Forsaken Love (New Generation, 256k XRAM, 26AE & 8ACE; simply
delete "BANKS.DAT", reboot and create a new one for your kind of XRAM!),
Glasshead Demo (A.R.+C.S.S., 256k XRAM, 26AE only!),
Halle 1994: The Wormhole (Magic Arts, 256k XRAM, 26AE only!),
Hardware Demo (A.R.+C.S.S., 256k XRAM, 26AE only!),
Igor Demo (Side A) (MadTeam, 64k XRAM, block E - use 128k.BAT),
Igor Demo (Side B) (MadTeam, 128k XRAM, blocks AE - use
192k.BAT),
Igor Demo (Side A+B) (MadTeam, 256k XRAM, 8ACE only - use
320k.BAT),
Imperial Sounddemo (Innovative, 256k XRAM, 26AE & 8ACE),
Impossible but Real (MacGyver, 192k XRAM, auto-setup!),
Incredible (Excellent, 64k XRAM, block E),
Inside Out (Taquart, 64k XRAM, block E),
Isolation Demo (M.E.C., 64k XRAM, block E),
Journey Demo (Boot version by Polynomials, min. 64k XRAM,
block E; supports up to 256k XRAM: AE/8ACE),

Journey Demo (File version by MadTeam, min. 64k XRAM, block
E; supports up to 192k XRAM: AE/ACE),
Journey into Sound (DGS / D. Garaghty, 64k XRAM, block E),
Khai Et (AIDS, 256k XRAM, 26AE & 8ACE, SHIFT for
Setup!),
Killer Whales Ani (MadTeam, min. 64k XRAM, block E, supports up
to 256k XRAM: AE/8ACE with more frames!),
Landscape-XE Demo (Karl Pelzer, 64k XRAM, block E),
Manga Ani (MadTeam, min. 64k XRAM, block E),
Megablast Sounddemo (DGS / D. Garaghty, 64k XRAM, block E),
MTV's Danielle = Danielle (Gr.9) Ani,

Nascar Ani (M. Sobe, 64k XRAM, block E),
Nonjm Demo (Tight, 64k XRAM, block E),
Numen Demo (Taquart, 256k XRAM, 26AE & 8ACE,
auto-setup!),
Ogluszacz Sounddemo (AIDS, 64k XRAM, block E),
Owca Demo (Animkomials, 64k XRAM, block E),
Owca 2 Demo (Animkomials, 64k XRAM, block E),
Pacem in Terris (Quasimodos, 256k XRAM, 26AE & 8ACE,
auto-setup),
Parrot XMAS Demo (A. Ramos, 64k XRAM, block E),

Pedrokko Sounddemos (a collection of 10 disks / 20 sides by
Pedrokko,
the player program assumes a 64k RD, block
E),
Raving Vierpz (Pentagram, 64k XRAM, block E),

Hello.
One other thing. I've been reading and it seems there's
a misconception about double density disks. I'm not sure about disk images,
like .ATRs, but a real double density disk in a DD capable drive will
actually have 256 bytes in sectors 1-3. You can verify this by looking at
sectors 1 to 3 with Disk Wizard or other sector editor, or Anadisk with a
PC. It is possible to write 256 bytes to sectors 1-3. The OS just boots
using 128 bytes, but the other bytes are there.

This is absolutely true for all Atari floppy drives. The whole disk is
formatted using 256 bytes per sector, but the drive "emulates" the
first three sectors with 128 bytes. This is kind of necessary if you
want to boot from a DD disk.

ATR disk images only store 128 bytes for the first three sectors.

Well, there seem to be some ATR images floating around with the first
three sectors stored with 256 bytes each (some emulators also support
this format), but these images are just broken: the ATR format
specification clearly states that the first three sectors have to be
stored with 128 bytes each.

so long,

Hias

Try cleaning the cartridge contacts as well as the cartridge socket contacts.

Rick D.

>Hmmm,
>does this technique of writing the 2nd side in reverse order also have
>something to do with time/timing ?!? Maybe the drive is faster this way

Yes, that's exactly what I said. The key to understand this is that the XF551 wants to be compatible with SS drives on the first side. This rules out the "normal" scheme of alternating tracks and heads. Then it is certainly faster to put sector 721 in the same cylinder than sector 720.

Sector 720 is on the latest/innermost track, track #39. This is true both for SS disks and for XF551 DS disks. Sector 721, on the XF551, is on the same track but on the other side/head.

>Meaning, it might be possible that the XF and its read/write head can
>simply continue the read/write/format process without re-positioning the
>read/write head, while other floppies may have to set the head back
>first.

I don't know how other Atari DS drives work, but I would guess they don't attempt to make the first side compatible with SS disks. Then it is better and faster to alternate tracks and heads. This means sector #19 goes into track #0 of the second side.

You can load two drivers...they have to have different address spaces, use
different names(R: and T:), and only one at a time, the other must be closed.

This method is used for 5 serial ports using an 850 and an ATR8000, not by me.

Hmm thanks! May get around to trying this sometime.

The UDS is not a perfect solution. But all and all, I am just happy to say
my Atari 800 is using DSL. Now that makes my IT friends jaw drop. :)

Ok, I was about to say... now now...

Then you threw in the CBM folk... in truth, if you were a CBM user in this
day and age, are you in fact holding onto a lost faith?

Are we in fact holding onto a lost faith?

Getting too deep... which goes against my new years resolution.

Back to my seven move games of Archon....

And what kills me is how we are able to still be just about as effective as
the MB and GB world.

We have our own Kb programs. We are able to tack on to the internet via
telnet, LOL guess the Atari8 just keeps riding that lower, no bloatware
lower carrier wave of high tech.

You know what amazes me is, while a Mac user myself (I started being a Mac user when I left the Atari 8 scene for real in 1989 and got a Mac 128K) I can't understand the intrigue or wowness of the size of the new Mac Mini.

True, the Mac mini is cute. I like the concept of the Mac Mini, and the iPod Shuffle. Small and cheap. love it! Probably will get a shuffle in the near future.

But computers the size of the Mac-Mini are not new. I remember going to a linux user meeting about two... three years ago, and there was a computer the size of the Mac mini. It was a small square. You attached it to keyboard and monitor. Kinda neat.

I guess the difference here is that computer was probably in the thousands then, and the Mac Mini is half a grand. Ok, that I could see. :D

515. AMS tunes...

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-27 03:58:26 UTC
From: Greg.Goodwin@family-news.org
Message-ID: <6391f7.3aaf4d@fmlynet.org>
Source record: 12921

I've been a fan of the AMS tunes for ... well, since like 1985 when I first heard them. And of course at that time, BBS's could only hold so much. I got a good selection, like Raiders of the Lost Ark, Star Trek, Cheers, MASH, and heard those several dozen times over the years.

And then recently I found like 54 arc'ed files of AMS archives... holy cow! :) Anyway, going through some of those. I've always liked how people have interpreted music into a format like this.

What is your favorite simple music format? AMS, MOD?

(No... I would not call MP3 a simple format.) :)

And how does one make a AMS song? Anyone remember?

With the sound of a organ, I think Phantom of the Opera would be perfect. Has anyone done that one yet?

Doc Clu 800

516. Digitized Sound Files...

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-27 04:04:30 UTC
From: Greg.Goodwin@family-news.org
Message-ID: <4391f9.3ab08f@fmlynet.org>
Source record: 12924

There was a format of music on the Atari I have also been looking at on the Atari8 aside from the AMS music... the digitized music. This was actually the first time I thought that music.. I mean REAL music, could be played on a computer. At that time it was all records and tapes. No CD's, and here I would hear sound clips.. about five seconds of...

Van Halen "Girl, you really got me now..." Ratt (Just a guitar riff)
Madona "And we are living in a material world and I am a material girl..."

And this was just the coolest thing I ever saw. Years apon years before Mr. Atari would convert full movies to play on the Atari 800xl, here it was... a crackly AM sounding music file. LOL!

I'm still amazed. How did they do that? How can we do it now? How could I take a 16 meg APE drive and play a whole song... or a whole album?

>OS issue why TB does not work with Sparta DOS X... -Andreas
>Magenheimer.

I don't know for sure, but I have a feeling that SDX can turn on and off
the cartridge to access it's routines, so it doesn't need the RAM under the
OS.

You could check the power supply (try another one or put a multi-meter on
yours.) Also you could check the RAM chips and other custom chips,swapping
them out to find out which one is bad. (They are probably soldered in so
that is no small job.)

Personally, I like MODs, but I've also been listening to streaming chiptunes
(Atari XL, ST, Commodore 64, Amiga, Amstrad, Nintendo, Sega, arcade, etc.)
music at work, so I guess I like it all. ;^)

> (No... I would not call MP3 a simple format.) :)

MP3 is not a /music/ format. (Not like MOD, AMS, MIDI, etc. are.)
It's simply an audio format. There's no music data... just one long sample. :)

The "Parrot" was a sampling device for the Atari that connected to the
joystick port(s). That's definitely one way to get the sample into the
Atari (especially way back then).

> How can we do it now? How could
> I take a 16 meg APE drive and play a whole song... or a whole album?

Probably. There might be an issue with loading, but if Mr. Atari's streaming
both video and audio off an HD, it's probably possible, at least with a MyIDE
setup.

The big issue (just as with streaming music on the net) is bandwidth...
can you load fast enough to keep playing the audio? (And at what point
do you have to downsample the audio SO much to get it off the disk
that it sounds like crap, and isn't worth the trouble? ;))

> then, and the Mac Mini is half a grand. Ok, that I could see. :D

I was at a friend's house, and he had a PC lying on his floor that looked
no bigger than the Mac Mini. (I had to ask to make sure it was a computer,
and not just some stand-alone DVD burner or something.)

He gave it to me for free. ;)

Mac Mini... FEH! I'll take a free PC (twice as fast as my old desktop, even!)
with Linux and KDE over a Mac any day!

(What, do I look like I'm made of money!?)

Point well taken. It's just that if I want to use the SDX cartridge to
create a bootable floppy that will run a disk based SpartaDOS with no need
of the cartridge I'm back to square one. The FORMAT command with SDX seems
to write a boot sector which works with same way with the XF551 as the XINIT
command with the disk based version of SpartaDOS.

Great. Now I'm getting my Bobs mixed up. Sheesh... I stayed up WAY TOO
LATE last night trying to get caught up with everything, and mistakes
apparently ran rampant. My apologies to both Bobs. :)

I was referring to Bob Puff of CSS who has been busy, not Bob Woolley... I
wouldn't mind getting my hands on one of these upgrades, and if I could find
a second XF551 for cheap I'd even try installing it myself now that I've
purchased my very first soldering iron...

I have been able to duplicate my efforts in switching densities on the XF551
"on the fly" with MyDOS 4.53/4.

First I conducted a controlled experiment. I booted the MyDOS SSSD ATR
image from APE. I then removed APE from the picture, turned on the XF551 as
drive 1 and hit system reset. MyDOS indicated the drive was SD. I then put
in a DSDD SpartaDOS disk and rebooted the system. The disk would not boot.

I then booted MyDOS in the same manner as above, switching off the XF551 to
reset it to SD mode in the process. After hitting system reset I then used
the P (Set Density) command in MyDOS to change the XF551 to DD. MyDOS then
identified the drive as DD. I rebooted the system from the XF551 and the DD
disk booted fine on the first shot.

So, I don't seem to have problems switching density on the XF551 from MyDOS.

Very interesting, indeed. I'd *say* there's a misconception floating
around! Everything I've read has indicated the first three sectors are
actually formatted in SD. When I boot a DD disk, the first three sectors
"sound like" SD, so I assumed this was correct. Additionally, when I used
DiskRX, a hex editor for SpartaDOS, to read a DD disk it showed the first
three sectors of the disk with 128 bytes and the other sectors on the disk
with 256 bytes. More "proof" to me that sectors 1-3 are formatted as SD.

One thing I found odd is that when I disassembled the first three sectors
the disassembler I used didn't seem to understand that the first three
sectors were SD, though. But that was all messed up anyway because it put
the 128 bytes of data from sector two into bytes 129-256 of sector one. So,
that was just weird.

I did load up Disk Wizard II 2.1 and checked out the first few sectors of a
DSDD disk formatted with the XF551 via SpartaDOS. It read the first three
sectors as SD, only showing the first 128 bytes. When I got to sector 4,
however, I was able to use the "H" command to see all 256 bytes. (The "H"
command was not available in sectors 1-3.)

Anyway, I'm certainly not arguing and I tend to go with what you both tell me. Actually, no "tend to" about it. I was just pointing out a few oddities I've run into with this. I'd guess the the drive "emulating" the first three sectors, as Hias put it, with 128 bytes is what causes these "oddities."

There was also one in the UK from I think 2-bit systems that went in the
cart port.

off on a tangent, I just remembered a 'scanner' I had on my 8bit. It was a
cart with a long fibre optic wire that you taped to the print head on a
1029 printer. The print head moved back and forth and the printer moved
the paper in small increments which together made a basic but usable
scanner for pictures, text etc.

Ok then. I was contacted off board by yet another benefactor who was able to hook me up with a few XF551 utilities including one called CONFIG.COM. CONFIG.TXT indicates this is a "Conifguration switcher for XF511" (not a typo - at least on my part) by Lizard of Filodendron.

This nifty (and small) utility lets you choose a drive number to config, 1-4, and allows you to set that drive to SD/SS, MD/SS, DD/SS and DD/DS. It was created for the XF551, but the author states it should be able to work with other drives as well... I must learn more so the dissection can begin... :)

So there you have it. I'd love to keep the discussion going regarding this issue if interest persists, and if anyone wants specifics regarding the file please don't hesitate to post (if appropriate) or contact me off board (if more appropriate).

I was informed by one of the principle of the A8 user group i was once with (way back when) that although Warners had plenty of XL(F)s in warehouses, after Atari was taken over by TTI (the tramiels) Uncle Jack chose to cancel the XL(F) and incorporate the technology into the 130 xe, in saying that, i am told that Warner's Atari never 'OFFICIALY' released/launched it

Apparently Atari had'nt gotten arround to doing a PAL version XL(F), just like the 5200, although this bloke i spoke with at this A8 user group had a motherboard from an 800xl(f), he said it wasn't PAL (he also had the only UK/EU compatable 1200xl, he modd'd it himself) and I do recall seeing BaPAUG showing a full fledged 1450 xl at the atari 90's computer show, can't remember if it was switched on or not

In that case it is wrong.

I had one, it had a Freddy in it, it did drive a PAL TV.
And it also had the chroma output and I got it driving S-video.

No. Track 0 is exactly the same as any other track on a DD disk. The first
3 sectors are 256 bytes DD (MFM to be more precise) as all the others.

Mixing densities on a track wouldn't make any sense and would be extremely
complicated.

As Matthias said, the first 3 sectors are "transmitted" to the computer as
128 bytes. That's the only difference. Without this trick you wouldn't be
able to boot from a DD disk because the ROM cannot read 256 bytes sectors.
So a minimal "standard" bootstrap is needed before "switching" to 256
bytes per sector.

Aw now Greg, you got me intrigued - how do you do a 7 move game of Archon?

(I'm assuming your going for the power points but you still have to *win*
each, right?) (and are you playing Dark or Light?)

Love that game, BTW. :-)

I have something of this ilk working in assembler on an 8-bit, it will take colours from a JPEG and convert them into Atari colours, it finds the closest Atari colour available, calculates the difference between the original colour and the Atari colour, and then uses that to modify the colours in the surrounding pixels. So, for example, if the closest Atari colour happens to be a bit redder than the original colour, the surrounding pixels will have a bit or red subtracted from them. It ends up producing checkboard like patterns that blend together to get as close to the original colour as possible.

Cool!

The problem with doing this with Super IRG mode is that you need to pick the best 4 (or 5 colors) to produce the ~13 displayed colors, based on the content of the image.

So instead of picking from 128 Atari palette colors, you're actually picking out of a much larger sample, but one which is restricted by your OTHER choice of colors. D'oh! :^)

I never did sit down and figure this out properly. I'm not so good with math, or graphics, really... :^/

I can see SuperIRG mode being used for slightly lighter-weight fullscreen images by using DLIs to produce different color 'zones' (a la the old paint programs on the Atari that had DLI support). You'd still need a lot of font data to get the actual pixels (unless you were extra-clever, which I know some folks out there are, as I've seen this done w/o SuperIRG ;^))

> -bill!

Agreed about the MP3's. So have you ever tried listening to a mod on the
Atari 8 bit? I think I did once. And a small one at that. It went ok. I
think it was Tom Hunt's player.

Good point. So the size limit of the original samples was more a limit of
the ram of the Atari computer and what it could be loaded into rather than
the limitation of disk space?

Streaming of Mr. Atari's movies... well, didn't look too bad.

My favorite line from the Plucky Duck show,

"Hey, don't complain it's free."

I try to tell that anytime someone makes a cool program for an Atari
computer and release it for free and people decide to gripe.

Especially ST users it seems. :)

Two bit systems eh? Interesting name.

I believe I have heard of that scanner. It always amazed me getting koala
pictures that were real pictures and the mention of a scanner then was like
"Whoa!". The mention of a 10 meg hard drive then was like "whoa!"

Now you can run a program that will convert gifs and jpegs to micro
illustrator format. But a scanner on the Atari is interesting.

So tell the tragic end, what became of that scanner?

My question is, did Atari actually use the label "800XLF" on the outside of
the machine, or on the box? Or did we the public just adopt the name "800XLF"
to differentiate these late-model 800XL's from earlier designs?

Anyone have a picture of something labeled "800XLF" by Atari?

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no
guarantees. Information of this nature constantly ages; therefore, the
information contained in this list is constantly updated. Please use the
latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Eric Bacher 9/02
France
http://ourworld.compuserve.com/homepages/ebacher/
Developer: DIS6502 1.4 -- Atari 6502 Disassembler for Win 3.1/95

Richard Bannister 1/04
See also: Chris Lam
Dublin
Ireland
http://www.bannister.org/
Developer: Rainbow v1.5.0 - port of Rainbow 1.4 (Atari 800 series emulator
for MacOS 9) to Mac OS X, Emulator Enhancer v1.4.1

Lee Barnes 10/04
http://www.mathyvannisselroy.nl/mydos.htm
http://www.mathyvannisselroy.nl/aspi.htm
Developer: MyDOS RAMdisk patches, Black Box ATASPI V0.42 ("Atari (Advanced)
SCSI Programming Interface"), Black Box ATASPI V0.41

Ullrich von Bassewitz 5/04
Germany

http://www.cc65.org/
Developer: cc65 2.10.1 - a complete cross development package for 65(C)02
systems, including a macro assembler, a C compiler, linker, librarian and
several other tools.

Michael Beck 5/03
Germany
http://www.rho-sigma.de/
Developer: Atari 8bit filesystem for Linux 0.1

Matthias Belitz ("msc") 10/04
http://www.birmanns.de/atari/
http://www.mathyvannisselroy.nl/aspi.htm
Developer: msc-IDE Controller (IDE interface for PBI/ECI -- sold out),
IDE software utilities: INSTALL.COM V1.03, SETUP.COM V1.13, FDISK.COM V1.10,
MAP.COM V1.10, HDINST.COM V1.00, LMAP.OBJ V1.03, CDPLAY.COM V1.0,
CDREAD.COM V1.4, IMG2DISK.COM V1.00.
Black Box ATASPI V0.40 ("Atari (Advanced) SCSI Programming Interface"),
ATASPI CDPLAY V0.20 (audio CD player), ATASPI MON V0.12 (SCSI monitor)

Bensley Consulting (Brett Bensley) 1/04
PO Box 301
Westfield IL 62474-0301
USA
tel: (217) 967-5465
Developer: Happy's Programs - Math, U.S. History, Astronauts, Triangles

Best Electronics (Brad Koda) 9/02
672 Commercial St
San Jose CA 95112-1406
USA
Telephone: 408-278-1070 (M-F 1:30pm to 5:00pm PST)
FAX 408-278-1092
http://www.best-electronics-ca.com/
Vendor: new hardware, commercial software
Developer: "XE" Touch, Best Joystick, Best Light Gun.

BeWeSoft (Jiri Bernasek - Bernasek-Werner Software) 8/02
Na Hrebenkach 42
15000 Praha
Czech Republic
Developer: BW-DOS 1.00/1.10/1.30, BW-DOS Update #2, Multi Dash, Multi Race,
Multi Worms (multiplayer-games for multilink/gamelink 2 hardware), Golfer,
H2O, Tetris 3D, Superpacker 1.0, Virus Scanner 1.0, Text Converter,
plus many other game and demo programs...

Adam Bienias 8/02
Poland
http://www.try2emu.cavern.com.pl/sap/
Developer: SAP -- Slight's Atari Player, Codecruncher 2.x and 3.x

B.G. Micro 4/02
555 N. 5th St Suite 125
Garland, TX 75040
USA
orders: 1-800-276-2206 or 972-205-9447

Ah - as I thought - you still have to keep and hold the power points. :-)

What joystick are you using Greg? That game just cries out for a top notch one and it seems they are hard to find these days.

I sure do miss the Wico joysticks. :-(

Commercial.

Yep. Though there wasn't much of a difference back then, unless you had
a hard drive, I suppose. ;)

Yeah, a few times. It was actually pretty good, once you find MODs that
worked right. ;^) (Talk about a diverse format!)

The STARWORX demo on the Atari is really just a little MOD player that
plays a MOD of the same name. (I happen to have both on my Linux box;
it seems the MOD was tracked by "4-mat" in 1992 or earlier. One of the
instruments inside is called "robhubbard-snare" ;^))

I can put 'em both somewhere online, if you want to compare. ;)

That is... I /believe/ that's the case. I _could_ be wrong. ;)

Also, I believe the Atari demo "STARWORX" was created by someone named
"Friday." (At least, it has "FRIDAY" down the screen in big letters ;))

> Love that game, BTW. :-)

Ok, did I say seven? Hw about five?

Move the Djinni to the middle power point. The archers take the top and
bottom power points. Naturally the dark side will try to counter this.
Take the Djinni and take the sorceress. This will get countered by either
the shape shifter or the dragon. Win that, play the Phoenix on the middle
power point, win the game. :)

Dark side, similar strategy. Just tested this. :)

Doc Clu 800

Yeh... yeh... Archon, Star Raiders, Joust, Wizard of Wor... played these games
for 20 years, hopefully I would be good by now. :D

Been trying to pick up new games now that I have APE working. So far,
Archon][confuses me.

Oh... ever play Archon and the computer switches one of his players for one
of yours, taking control of your character and using it against you?
Weirdest thing.

I remember around 1986 a lot of 8-bit users in the Dallas area were selling
heaps of Atari 8-bit stuff for the ST. I was a broke high school student,
so I had to stick with what I had.

They were overjoyed at first to have the Atari ST 520 or 1040 with it's
one med of ram. They were happy with the graphics, and there was a lot
of talk of Sundog, and other games. And then... silence.

One thing I heard a lot back then was how they regretted selling their
8-bit setups in hind sight. Said they came to know and rely on the
8-bit file system, and that they didn't trust ST disk management. And
then, one by one, they faded from the Atari scene. By 1989, sice I
stopped going to the Infomart, and lost track of Atari activity in the
user groups, and there were no readily visible Atari BBS's, I figured
Atari was all but gone and that I was the last Atari 400 user in Dallas.
:D Probably was. Hehehe.. Anyway, your story reminds me of theirs.

Hey, tell me more about this suncom trivia game. Got me curious. :)

Much the same here although in Europe there was far more for the ST. Went
from a 520STF (2.5MB) to a 4mb Mega STe then a Falcon. I had 3rd party
desktops, OS's, etc plus external HD, modem, scanners, twin monitors
(colour & B&W), games and utilities galore. Kept me going until about 1992
when I moved over to PCs. By then I'd rebought a couple of 8bits and a
floppy drive, mainly to play MrDo!

> Hey, tell me more about this suncom trivia game. Got me

It was a trivial pursuits clone that came with four seperate
hand controllers with 1,2,3,4,5 or maybe a,b,c,d,e buttons. A question
came up and you had to answer it before anyone else. Not much more to
tell. It did get a mention here fairly recently so a google would probably
find it.

568. MSS1-T to BlackBox cabling help!

Newsgroup: comp.sys.atari.8bit
Date: 2005-01-29 00:06:23 UTC
From: jamesk@ATxmissionDOT.com
Message-ID: <ctek1v$q94$1@news.xmission.com>
Source record: 12873

I'm trying to create a new cable from my BlackBox to my MMS1-T.

According to the BB manual, the pin outs are:

Transmit Data, Pin 3
Receive Data, Pin 5
Req to Send, Pin 7
Clear to Send, Pin 9
Data Set Ready, Pin 11
Signal Ground, Pin 13
Carrier Detect Modem, Pin 15
Data Term Ready, Pin 14

Now, if I read my MSS manual correctly, the pins for the MSS1-T are:

TX Out, Pin 2
RX In, Pin 3
RTS Out, Pin 4
CTS, Pin 5
DSR In, Pin 6
Ground, Pin 7
CD In, Pin 8
DTR Out, Pin 20

I'm using DB25 to RJ45 headers, so there will be a CAT5 cable (8 pair)
connecting the two together.

If any of you guru's out there can map out the pin outs (from one DB25 to
the other), I'd be most appreciative.

I've already tried a one to one (pin 2 to pin 2, etc) and a direct mapping
(Pin 3 on the BB to Pin 2 on the MSS).

The only way the MMS works (using it now) is to connect a Null modem
adapter between the Blackbox cable and the MSS's 25pin serial interface.

Any assistance greatly appreciated.

Both great apps; have not played the trivia in about 15 years, but we had MrDo out weekend before last - seem to have lost my touch; I once rolled the score over past the limit to zero at about level 90 but have lost the photo we took of the screen.

>Which one is better? ;) All around performance ratio and stuff...

Actually if you look inside both computers, the Atari 8-bit is the better hardware. A computer geek in our area said the C64 was a stupid computer hack and did not have the necessary chips to call it a computer. I had a C64 for a short period of time. It was nice, but I finally got rid of it and stuck with the Atari.

It was always a stupid comparison: An Atari that came out in 1979 with a C64 that came out 3 years later. People that did that kind of thing and try to draw conclusions have no intellectual honesty. The real comparison was a VIC20 to Atari 800. The Atari side didn't do ST vs. C64 and try to hang their hat on it even though the ST came out only 3 years after the C64, by then the targets were ST vs. Mac.

Well, the Atari 800 wins against both the VIC=20 and the C=64, so why
bother?

Uh, could become a problem. Shipping such a beast to the U.S. would cost
EUR 12.90 in postage (not to mention packing/handling costs). As
Dynamics (the producer) were located in Hamburg, Germany, I guess it's
hard to find these sticks outside of Europe.

Nonetheless these joysticks were so popular that a USB replica has just
been published here and they still are sold well on eBay (a local flea
market may of course be the much cheaper source, but apparently this is
not common knowledge :-)).

<edbaizjr@comcast.net> wrote:

>Actually if you look inside both computers, the Atari 8-bit is the better
>hardware.

I agree, but both systems have their advantages. The Commodre could
display more sprites and the Atari had more colors. The Atari was
limited to monochrome in it's highest res as well while the Commie
could do some colors, but the Atari could do some amazing shading with
it's built in GTIA. The Pokey cannot do the types of instruments as
easily as the SID does, so is not as adept at music, however, it does
special FX better.

The Atari seemed to have all the best ports of games in the early 80's
but by the mid 80's and beyond the Commie was getting the preferred
treatment and many games for the 8bit were weak ports from that
system.

Another thing to consider, the 800xl was less expensive then the c64
(in the US at least) so 8bit Atari's were more affordable. I think
most people will agree the black/white industrial looking XL series
was much cooler looking then the ugly C64 "breadbox" look.

In the end the computers are pretty evenly matched (which gives the
edge to the Atari hardware considering it was designed 4 yrs before
the C64 was released) and there is no real winner. It comes down to a
matter of preference.

Thats the whole point of the minimac.. for those of us that arent made
of money but dont want 'yet another ix86 box'.. (though you can get a
used G3 these days for pretty cheap).

And dont forget, OSX has a BSD UNIX heritage..

Was going to offer you one, but I have noticed no one takes me up on
offers... but when I sell it they believe me. More on that another time.

Wico joystick... log in to the Atari BBS's or join the Tuesday, Thursday,
or Sunday chats and maybe you will win one. That is one of the prizes I
will put in the mix to be chosen as a prize.

January's chat and BBS's winners will be announced in three days.

And to answer your question... have many Atari game controllers and
controllers I've adapted from other systems. Even "The Best Joystick" a
modified CX 34 (7800) stick with auto fire. But I really like the basic
Atari joysticks that came with the 2600 400/800 best. And don't really
care for Wicos strangely.

That was one of my favs for the Coleco vision. Just get Venture on the
Atari 800 (Space Dungeon is kinda close for me) and I will no longer need a
Coleco vision. Get TRON deadly discs on the Atari 800, and the
Intellivision will no longer be needed. And get Atari 2600 Warlords on the
Atari 800, and I will no longer... well, I would probably keep a 2600
around.

Castle Crisi is good BTW.. just bought it and love it.

I think when I got a collection from Chicago there were a pair of these
controllers in it that went to that game. Cybernoid and I were looking at
it going "What the heck?!" And was thinking of putting a picture of it up
on some JYBOLAC picture archive. Maybe we'll get around to it one day.

Now just to find the game to go with the controllers and we can try it
out.

Funny you should mention that, since I will be releasing, for the first
time since the 80's, "THE ATARIANS", which is a GI Joe style story where
Atarians fight Commodore Users. Lot of cheese and fun, and a lot of
laughs. It was written by Atari users on the JYBOLAC BBS in Dallas,
TX-USA, and will be available on a Atari BBS starting February. :D

(And they'll be released in monthly episodes.)

Atari Vs. Commodore. Being that both are still alive in development by
the fan base, I would say both.

Commodore by far has the largest fan base.

Both have made great achivements since they were discontinued by their
parent companies.

I am glad Commodore is still out there. They inspire us, and at times,
we have inspired them. May we continue to be rivals and contemoraries
for years to come I say. :)

I would say 800 vs Vic-20
800xl vs C=64
130xe vs C128
ST vs Amiga vs Mac
All trumped by Silicon graphics, PC, and sometimes Mac. :D

Nah. C128 was pushed as the 'next generation' of C64. 130XE hardly compared in price or demographic terms to the C128/D which was uniquely isolated (and frankly, crap) in the market.

I like pitching C128 vs. Apple IIgs. IIgs kicks it's arse in every way ;). Commodore people like pitching Amiga vs. IIgs, where the competition is a little tougher on account of the Amiga being a Mac competitor.

> ST vs Amiga vs Mac
> All trumped by Silicon graphics, PC, and sometimes Mac.

And the Mac won, really, as Commodore and Atari were brands as much as platforms.

Which makes this a bad matchup.

. Commodore people like pitching Amiga vs. IIgs, where the competition
> is a little tougher on account of the Amiga being a Mac competitor.

LOL... I think the IIgs can pull a few surprise punches though. How about
a fun fight.... the Commodore 4 verses the Apple]|[. :) Which one of
these edsels will win? LOL

>> ST vs Amiga vs Mac

You mentioned that Mac won since Atari & Commdore were brands as much as they
were computers. Technically, isn't Mac as well? Mac really odd... a
computer company that makes it's own OS, has it's own platform... and made a
name for itself with this 80's computer mentality that it is actually
thriving now. (While all other companies making computers are just PC clones
for the most part). There is little difference between Atari ST, Commodore
Amiga, or Apple Macintosh, except that Apple was more stubborn and marketed
better? Well, at least more stubborn.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Well, the C=128 was enhanced in many more ways than the 130XE, e.g. it had an 80 columns video mode, CBM Basic 7.0, a second (Z80) CPU for CP/M apps and an all-new case. Nonetheless, it was quite a flop, making it an expensive beast on eBay nowadays :-) (not quite as expensive as a PAL Atari 800 though).

The 130XE just had more RAM and sold much better at least here in Europe, obviously being carried to success by the ST series. And more and more European programmers - mostly from the UK and Poland, but also some from Germany - published software in the late eighties (some titles worth mentioning are "Druid" by Firebird (the XL conversion of Gauntlet is a heap of shit in comparison), "Elektraglide" by English Software, "Zybex" and "Draconus" by Zeppelin, "Amaurote" by Mastertronic, "Unicum" by Andre Christiansen and of course the most mentionable non-game title "Turbo-Basic XL" by Frank Ostrowski. Sorry for not mentioning any Polish titles here, but I already had an ST when they washed into the German market.

The 130XE is nowt but a 65XE with more RAM in it. The 128/D is a vastly
different machine - the DCR has 64K of video memory, they have /3/ CPUs
IIRC (two in the 128), the 128 offers 80 column modes and so forth.

Hence, my 128 vs. Apple IIgs - like the IIgs, the 128 was considered the
'next generation' and was very compatible with the previous model. The
130XE /was/ the previous model, basically.

> Which makes this a bad matchup.

Indeed. But it's on market, not technology. The 128D was totally aimed
at the same market the IIgs was.

> LOL... I think the IIgs can pull a few surprise punches though. How about
> a fun fight.... the Commodore 4 verses the Apple]|[. :) Which one of
> these edsels will win? LOL

Hmm, tricky. Does usefullness as a doorstop come into play?

Actually, I reckon the /// wins, but it's an unfair comparison for both.
Really, it should be CBM MMF or 8256-SK vs. the ///.

Why does the /// win? Well, it's fully backwards compatible with the][,
when the Plus/4 wasn't compatible with anything really. And it is well
made and actually quite reliable (if you remember to drop it), whereas
TED death is so commonplace, working Plus/4s are probably rarer than
///s. And the /// had decent colour graphics, but most people never even
realised it. Not as many colours as the Plus/4, but very sharp.

Enterprise beats the lot in terms of real 8-bit supremacy, though.

> Amiga, or Apple Macintosh, except that Apple was more stubborn and marketed
> better? Well, at least more stubborn.

That's what I mean. Ultimately, PC won. But PC is a 'standard' sort of.
Apple, Commodore and Atari did their own thing, but Apple is the only

one remaining and impressively it survived by not trying to make PCs, which Atari and Commodore tried.

Though the sarcastic amongst us say Apple died in 1998 and NeXT is thriving, I actually consider Apple of 2005 to be closer in spirit and product to Apple of 1977 or 1983, than Apple in the mid 90s.

Plus - my big rant, you've seen it elsewhere I think - Apple did maintain the link between the][range and the Mac. My Apple IIgs shares files - not with null modem cables and third-party programs, but with AppleTalk and Apple's own OS - with a Macintosh server. It reads Mac disks, as well as the other way around.

Atari and Commodore both made their 16/32bit ranges almost utterly incompatible with their 8-bit ranges.

Richard

Both certainly have their advantages. Although an Atari user all along, I have to admit the C64 has better graphics.

On the other hand, as far as a computing platform, I like the Atari OS and DOSes (like SpartaDOS) much better than using basic commands to access DOS functions built into the disk drive's firmware.

As far as performance, I know the NTSC Atari 8bits ran at 1.8 Mhz vs the 1.0 Mhz of the C64 and Apple II. I don't know if that translates directly into 1.8x the computing speed of a C64, but others may have more info on this.

How did you convert from dbl to sngl density?
It could be as simple as copying files from a sngl disk to a dbl.
Or did you try to sector copy from sngl to dbl?
Some boot loaders require to be a certain density.

They were/are both great computers (C64/128, A8) I would say this, tho, the
C64 was really slow disk accesses, I'd say the Atari is/was an order of
magnitude faster (10X). I didn't try the speeding up solutions available
for C64, I guess it is sorta like the US Dblr increase in speed.

With age, I've obviously lost a few brain cells.

But... from SpartaDos (or SDX), how do I go about formatting (erasing) ATR images loaded via APE?

Seems I cant erase any files or wipe the ATR image. On APE, it shows the ATR is unlocked too.

Thanks.

Are you sure you have a registered version of APE?

If not: set ape to 1x speed. Then it will work. Ape (shareware) do not write/erase/format etc. in highspeed sio.

When you want to have 100% fun of ape, please register. It is really a great program.

Marius

Bzzt. You're in the '16 bit product line' now. Apple
IIs-Atari800-Commodore PET/VIC/C64. Amiga-ST-Macintosh.

Richard (hey, just because Apple happened to use a few extra bits -
still runs the same software as a 1977 Apple II :D).

I like the Atari's sound chip, when it's done right, ie Rob Hubbard and
stuff. The colors is much better on the Atari and the processor is faster.
The sprites on the C64 is better than the PM's on the Atari, but not always.
I've done things with PM that the C64 sure couldn't do.

Atari all the way in my opinion!

I recently received my own C-One (Commodore One) reconfigurable
computer that currently has cores for the Commodore 64 and several
Amstrad 8-bits, and put a smallish review / photo collection online at:

http://www.bytecellar.com (Currently the top story on page)

May be of interest to those beyond Commodore / Amstrad as it is a 20MHz
65C816-based machine and other cores will be forthcoming. (A "native"
core and an Apple IIgs core down the road is rumored.) At any rate -
just an FYI to those interested.

Thanks.

bp

SIO transfer from floppy was 19200 bps AFAIR? This would make it abt. five times faster than the C64s standard transfer from a 1541 floppy drive. With software only solutions the speed was easily bumped up that five to six times. This was however quite uncomfortable (similarly to the need of "booting" the DOS in Atari) in a sense that was not available immediately after power-up. The hardware add-ons were much more comfortable and faster. The fastest (DolphinDOS, PrologicDOS, ProfessionalDOS) were loading up to 25KiB/s, which kicked ass out of every _standard_ SIO transfers. I don't know what were the fastest Atari h/w floppy speeders (of the eighties last century) and how they performed. Any reliable data on those?

606. DGS Atari 8-bit CD compilations - banned by eBay!

Newsgroup: comp.sys.atari.8bit

Source record: 12961

Further to what I already said, it would apear that Ebay's business dealings with Dean are not consistant, after all if Dean was selling exactly the same s/w on ebay now, as he was 2 years ago, and that 2 years ago and since then, ebay has has no problems and now qualms about doing business and taking money from dean for selling his software collections on ebay

Also the fact that dean had originally sent ebay all the documentary evidence to prove that he has rights/licences to selling these compilations etc any which way he sees fit (either as a business or privately) and also that the fact that ebay accepted these documents unchallenged 2 years ago, its strange how ebay are now in effect saying that dean is now selling illegally obtained software, illegal/copied software or pirated software, and yet this is the same software that dean's been selling on ebay's internet service for the last 2 years unchallenged

If it's the same Dean Garratty that I know of (remember AMS 94 in stafford, How is Richard G., by the way I hope Richard's still enjoying the 810 (or was it a 1050) that he bought from Peter) then Dean and I both know that in the UK we have some of the worlds strongest and strictist libel, slander and defamation laws

I bring this late point up because, if you read bettween the lines, Ebay (in their infinite wisdom) are in effect in/directly accusing Dean of selling and offering illegally obtained software, illegal/copied software or pirated software (either privately/commercially) and as dean as supplied (originally) documentary evidence to prving that he isn't dealing in illegally obtained software, illegal/copied software or pirated software and that ebay accepted this for two years unchallenged

And as ebay are accusing dean of pirating software and offering it on ebay's website then technically and from a legal standpoint Ebay is aiding and abetting software piracy, allowing others to sell their pirated software through eaby's service and therefore allowing them to infringe int'l copyright laws, and in addition,m as this is also taking place through an ebay service, then ebay is equally liable under internation copyright laws, and subsequently infringing them

And also the libel, slander and defamation law aspect of this pertains to ebay making what can be construde in certain circles as libelous and slanderous accusations, and altimately defaming deans 'good character', i say this because ebay (going by dean's original posting) have not a shred or evidence or anything to substanciate their original accusation that dean is selling/offering illegally obtained

software, illegal/copied software or pirated software (either privately/commercially), and subsequently, i am assuming that dean was approaching them (ebay) in a comnmercial sence (as a business/sole trader) therefore dean can prove in court that ebay's claims andf accusation's has serverely damaged his business and his business reputation and also sue ebay for restraint of trade, and added to that would be the libel, slander and defamation law (from a business point of view)

I will heartly suggest or advise that Dean seek indep't legal council (solicitor/lawyer/barrister type bod) preferably legal council willing to work on a no win no fee basis and sue ebay for every penny they've got (yes, i guess like the americans, i'm a believer in the 'compensation fee' culture... or litigation culture'

If you do decide to go down this route Dean, don't forget that if you are successful and you get a judgement in your favour, dont forget to share the wealth (as it was me that suggested this to you in the first instance)

>I recently received my own C-One

Nice.

I guess it boots the C64 core, displays the menu, and jumps to the C64 ROM
if you select C64.

Do the Z80 machines require you to change the CPU card,
or is the Z80 implemented in FPGA?

The 65C816 could have been put in the FPGA if there is room for a Z80.

Jeri uses two Altera FPGA in the C1, and these use non-volatile
configuration memory. I assume there is a finite number of reprogramming
before it wears out?

> Apple IIgs

Interesting. I'm looking at cloning an early Apple Mac, and I see it uses
the same Integrated Woz Machine FDC as used in the 6502 based machines. I am
looking at the logic in the six PAL chips which is hard enough but there
isn't much info about the IWM. Then again, Apple-format disks are fairly
dead, and even floppies are being replaced with CF and SD memory cards.

I'd like to chat with Jeri again but I haven't been able to contact her for
ages.

She don't write no more :-<

Actually, it boots the Amstrad core - but it comes with a risc cpu
that's also capable of running 6502 code (which is what the boot rom
is written in).

K> Do the Z80 machines require you to change the CPU card,

No.

K> or is the Z80 implemented in FPGA?

Yes. It's actually a small RISC CPU that interprets Z80 and 6502
opcodes.

K> The 65C816 could have been put in the FPGA if there is room for a
K> Z80.

Sure, but that would take up a lot of precious space that is better
spent on graphics and sound.

K> Jeri uses two Altera FPGA in the C1, and these use non-volatile

No, what you are talking about are PROMS, that have limited life cycle, of n reading/writing operations (ie. 10,000). An FPGA is made out of SRAM elements, and you don't have to live with any limitation.

> Interesting. I'm looking at cloning an early Apple Mac,
[...]

If the PAL's security chip hasn't been blown on those, it's very simple to read the equations and duplicate them. I mean, if you send them to me, I'd do it for you. Just gift me a few empty ones :-)

> I'd like to chat with Jeri again but I haven't been able to contact

Hi,

BTW, thanx to Tobiflex at the moment it's more a CPC-ONE than anything else. Now even the third CPC Core is available, but the one C64 core is still NOT ABLE to read D64 images! So you shouldn't call it "Commodore One" anymore...
The C64-part of the C-ONE is still more or less useless. It seems that Jeri changed her main focus to other projects and let Jens alone. Note, that the C-ONE is ready since two years, but the C64 core is still not finished, which is very strange!...
But good luck for the CPC scene, that Tobiflex entered the project and created the first full running core - the CPC core! :-)
I am a lucky owner of a C-ONE and it's really fascinating!! :-)
Regards,
Prodatron

Try the #c64friends chat on saturdays, she's often there and talks C1 and
DTV. There's a posting on comp.sys.cbm every saturday detailing when/where
it happens.

Hey, Silver.
25kbps isn't a whole lot faster than 19kbps. I guess you're saying you could get hardware speed-ups, as well as software ones, but the software ones still required a slow boot-up. 19.2kbd was satisfactory to me. The Atari had hardware speed-ups, but I didn't like them, as they weren't as reliable as standard speed. I think up to 56kbps is the speed of the US dblr mod. APE can do up to 4X speed I think. But I'm talking the stock, native speed.

The 1050 Turbo used some 70kbit/s, the Happy and Speedy were
running at approx. 50-55kbit/s. The Speedy also supported a
special highspeed mode at some 80kbit/s, but this mode was
only available with the highspeed sector copier that came with
the Speedy.

If you need more accurate values I could try to search for them.
But anyways, 50-70 kbit/s is a little bit faster than 25kbit/s :-)

so long,

Hias

I don't know, I can't comment on this.

> Note, that the C-ONE is ready since two years, but the C64 core is
> still not finished, which is very strange!...

Probably it's difficult to implement a perfect emulation of the C64. Don't forget that one of the reasons the C65 (an "updated C64" that never made it to shelves) was cancelled, was it's lack of compatibility with the C64. Even Commodore itself had problems implementing a faithful emulation of a C64 in the short time a team of engineers and consultants worked on the C65 - less or more one year.

I personally don't find it strange, Jeri works alone. It's incredible what she's been able to put together on her own.

> But good luck for the CPC scene, that Tobiflex entered the project and
> created the first full running core - the CPC core! :-)

This is nothing but good news for CPC users, but to potential C-One customers as well. I find the reconfigurable option THE amazing feature of Jeri's project. Other cores surely will be implemented, after more C-One will land on good developer's desktops around the world.

> I am a lucky owner of a C-ONE and it's really fascinating!! :-)

Congratulations, I think you did a good buy.

Riccardo

> Hey, Silver. 25kbps isn't a whole lot faster than 19kbps.

I was saying 19200 bps vs. 25KiB/s transfer speed. This means I was able
to load the full memory in about four seconds. No standard SIO could
come even close to that. Dunno about the h/w sped up rigs as I wrote in
my previous post.

> I guess
> you're saying you could get hardware speed-ups, as well as software
> ones, but the software ones still required a slow boot-up.

Kind of. One had to load the speeder software first, then the actual data.

> 19.2kbd
> was satisfactory to me. The Atari had hardware speed-ups, but I

Hm, interesting. That's still quite a bit of speed but what you mean by
"not reliable"? Transfers? Data longevity?

> APE can do up to
> 4X speed I think.

APE AFAIR wasn't available in the 1980ies.

> But I'm talking the stock, native speed.

The stock speed of C64 with 1541 was as I wrote already. With 1570/71
was _slightly_ faster. The C128 with 1571/81 was somewhat (guessing not
stating as I didn't really measured those) 2.5 times faster, which still
makes it well below standard SIO.

I would be happy to know them. Both the transfer and the actual load
speed would be perfect.

> But anyways, 50-70 kbit/s is a little bit faster than 25kbit/s :-)

You also misread what I wrote. That makes me thinking what I wrote wrong ;-)

The standard "warp" seed as implemented in the US Doubler, Happy and
clones is ~52.6 Kbps. There is a slight difference in each direction (when
transfer by the drive or by the computer), and the latter also slightly
differs between PAL & NTSC systems. The drive to computer speed is exactly
19 microseconds.

The actual "load time" would depend on many factors. For example the Happy
is a buffered device but the US Doubler is not. Sector size, etc.

Btw, I've found warp speed to be very reliable. Never had any problems.

Need more info... are these boot disks or simple binary files? Are you using
a bootstrap loader? These game 'dos'es are density specific because they use
raw SIO and extract the link bytes from expected offsets into the sectors
rather than utilizing the file management system.

I know. How we used to measure "load time" some ages ago was to store a
long enough file on a freshly formatted diskette and then read it back.
It had to be freshly formatted to allow the same practical conditions
for all measurements i.e. "starting from scratch". If you could measure
e.g. load (and save) time of 30KiB file and give the results in seconds?

> For example the Happy
> is a buffered device but the US Doubler is not.

Sure. This is why "load time" != data_size/bps and this is of course a
factor for eveluating the speeder.

> Sector size, etc.

That's more tricky I guess, but just take the fastest then.

>
> Btw, I've found warp speed to be very reliable. Never had any problems.

I was wondering what could be unreliable in that. Maybe over a very
long, low quality cable...

I can't promise this would lead you anywhere, but various products have
emerged over the years that can read and write Apple- and Mac-style disks.
I know there were ISA boards for PCs that could do this, for instance, and
there was also the Spectre GCR Mac emulator for Atari STs. You might dig
up some relevant information by trying to research these products.

Ok, sorry KBps is bytes ps, not bits.
No, Ape wasn't available. I was saying that high speed on the hardware side wasn't reliable, ie. read/write errors. I never used them. I did use a very fast alternative, there was a device called an MIO, it had RAMdisks in it that could boot a 13K byte DOS in about 2 seconds, I guess that makes it 6.5 KBytes/s. But... I'm talking about a stock computer, using 'standard' drives.
What was the serial port speed limit? For Ataris I'd say it was 9600 baud, 19.2 Kbaud theoretical.

Did you then load the files directly from within DOS?

If yes, it could well be that the DOS you used needs more memory than
your old single density DOS and/or is not fully "compatible".

BTW: You could try using MyPicoDos from my homepage
http://www.horus.com/~hias/atari/

MyPicoDos is a "gamedos" that works with both single and double
density disks, and as far as I tested it can start most of the
game files you can find on the 'net.

I used high speed with Happy drives for virtually my whole "Atari life",
and never had any problems. What kind of errors you got and using which
kind of device/upgrade?

There was a known issue with some XE computers and some 1050 drives that
had a couple of extra capacitors. You had to remove them to make high
speed work.

Yes, the MIO is great. Perhaps the most powerful 3rd party add-on.

IIRC, the Z80 emulation (or lack thereof) was one of the reasons given why a
C128 core could not be implemented for on the C-1. Does this mean that a
C128 core has become a possibility?

> One" anymore...

I would like to point out that .d64 images are for use on _emulators_, and
are not for use on the "Real Thing"(tm) C64. ;-)

Although .d64 images can be used directly on a _software_ C64 emulator, the
fact that they can not be used directly on a _hardware_ C64 emulator is an
indication that the C64 core is closer to the "Real Thing"(tm) than some of
the software emulators.

The reason I used the term "directly" above is that software is available for
the C64 that enable it to either create .d64 disk images, or dissolve them.

You are thinking in terms of the c-64. This doesn't apply too much for the Atari.

The limitation of the SIO speed on the Atari is fixed by the peripheric firmware. You can't change the SIO speed without a hardware modification on the drive. Once you upgrade the drive's hardware, the modifications needed at the computer are more or less the same for every drive upgrade. As a matter of fact the same software was usually used disregarding the specific hardware modification.

This means that for comparing one hardware mod to the other, the dominant parameters for the overall speed are basically two, the xfer speed and whether the drive upgrade is buffered or not (if it has enough memory to buffer a whole track or not). There is of course some overhead and other factors, but they are not significant.

So that kind of measurement you mention you used to do, was rarely done on the Atari. There wasn't much need to do that. Furthermore, there weren't too many variations of transfer speeds or hardware mods. And of course, the faster speed was useless for most original copy-protected disks anyway.

Intriguing. I guess that bit is in one of the non-volatile FPGAs?

I've been puzzling over the FPGA booting process for my own project.
I have a hard 65C02 and Flash ROM already, so I could them to config the
FPGA, but then I'd need some RAM and a small CPLD for minimal memory / io
decoding.
In the end I think I may just use a small AVR to do the job.

> Yes. It's actually a small RISC CPU that interprets Z80 and 6502

I presume the Daniel Wallner T65 is just a part of the CPC project.

> spent on graphics and sound.

Agreed. MikeJ is working on a 68K design, but I suspect that will take up a
lot of FPGA logic. AFAIK, you can still get 68K CPUs fairly easily and
cheaply. I saw them for about £7 each in packs of 18.

I don't want to work on cloning the IWM to write to media that I can't read
on my laptop, in formats I can't read with a USB FDD.

In fact, most 'vintage' machines have incompatible disk formats (esp. CP/M
machines!) so that's another good reason to avoid them.

Thanks for the tip though :-)

These disks were flippies with one platform on each side; definitely for the
A8 home
computers. Not certain if this was before or after Atari had it on cart;
likely before
as they had several titles on disk which later became Atari Corp carts with
little change.
Probably compatible to all 8-bit, but not the 5200; might need translator
on XL/XE.

The one I have is like the 5200 version. It would have came out after the
Atari version I think. I bought it the same time I bought Mr. Do and they
are both Atari/Commodore flippies.

OK. Someone already mentions that some game 'boot' disks, ie. menu loaders
are density specific. I suspect you're copying from a game disk to a DOS
disk and these are games that don't load with DOS because they require
memory that DOS uses. Mathias suggests a game loader, MyPicoDOS. Many,
most commercial games need such a boot DOS.

I only ever used ICD US Doubler, and APE for any high speed stuff.
My Indus wouldn't work at higher sector numbers, above 650.
The US dblr ultra-speed sector skew is what I'm talking about, on real
drives. I may have screwed up just one disk and came to the conclusion
never to use high speed again. I remember the high speed with SpartaX would
consistently screw up. The disk gives a sick 'pffft' instead of a 'honk
honk honk', you know it is sick. And this disk is unusable, can't re-format
it. My drives, like everyones, are old and cranky. My RANA wouldn't load
certain commercial game disks because the copy protection wouldn't get the
right error. Some commercial games wouldn't load if an 850 was attached.
Those who get good results with high speed, well, I don't know what my
problem is.

i'd like to order one too... and prob would with a gs core...but at $298.90
(incl serial card option at $20.90eur) that is $298.90 without shipping
i'd guess from europe..duh...well when you convert it to usa dollars as of
todays date 1/31/05....it is according to my converter $$$ to eruo web page
$390.13 and again you have to add shipping on top of that and of course
case, power supply, scandisk card, memory etc etc

ouch...

so yeah if it had a //gs core ...but you better save your pennies now..it
might take a bit of saving...

No idea, I'm not a Z80 guy :) However, the CPC core runs in the 1k30,
the smaller of the two FPGAs, and is tuned towards performance and
features rather than 100% compatibility (though it runs the games that
I've tested). If someone was so inclined, they could put a cycle exact
Z80 core with undocumented opcodes in the 1k100 for better compatibi-
lity.

Well, the interaction between the Z80 and the 8502 in the C128 is
different from how Tobias' RISC CPU deals with it, but it certainly
shows that it's possible to have boths CPUs available at the same time
in a C1 core.

Jeri uses a CPLD (a 3032 iirc) with a state machine to load data from
rom into the 1k30. Once the 1k30 core is bootstrapped, it takes over
the boot process.

K> I presume the Daniel Wallner T65 is just a part of the CPC project.

No, the RISC CPU is Tobias' own design, and the Z80/6502 opcode tables
are just RISC instructions.

Isn't this just playing around with terms? I like to load discs from
the CF-card or harddisc. How else could this be done, if the "disc"
isn't a D64-image file? Of course if would be great if you could
connect an original C64 disc drive to the C-One, but that would only be
an other option.

Regards,
Prodatron

Yes, you can connect a Commodore disk drive to the C1 via its
serial port.

Yes and Yes. The Risc can run Z80-Software with undocumented Opcodes. Its
full softwarecompatible but not cycle exact. The 6502-Software runs only
with documented 6502 opcodes and any special C-One-Stuff Opcodes.
The Risc needs about 500LC's of the FPGA and needs support RAM of 64Kb for
the Z80 and 6502 Tables.

The startup system and the CPC-Cores works without a hardcoded Z80 in the
1K30.
Currenly I'm working on a TurboCPC with Daniel Wallner's T80. The TurboCPC
is an own Design for the big FPGA(1K100) on the C-One. The CPU clock is
16MHz.
look here http://c64upgra.de/c-one/download/cpc_study.zip
There is an early version of the core. I hope to finish the work on it in
the end of february.

Cool :) This is the CPC equivalent of the 20 Mhz C64 core I guess? Are
you also adding hires graphics modes?

You'll be able to load standard program files. D64s are only useful if
you want to emulate a 1541, and for simple file loading and saving
there's no need for that.

P> Of course if would be great if you could connect an original C64

Of course you can, that's what the IEC port is for.

There must be something with this ;-)

> This doesn't apply too much for the
> Atari.

Hm... What I asked is something like "how long would it take for the
particular setup to load 30KiB of contiguous file". Doesn't loading of
the files from floppy apply enough to Atari as well as any other machine
of the said era?

>

OK. But this doesn't tell me anything about what is the real-life
performance.

> This means that for comparing one hardware mod to the other, the dominant
> parameters for the overall speed are basically two, the xfer speed and
> whether the drive upgrade is buffered or not (if it has enough memory to

> factors, but they are not significant.

Yes. In the CBM world similar factors were to be considered but still
what was of the highest interest, was not really what the mod/add-on had
in its guts but rather how it performs. This is what I am tring to get
to know (out of curiosity).

>
> So that kind of measurement you mention you used to do, was rarely done on
> the Atari. There wasn't much need to do that.

Sure. There wasn't any practical need on C= either. It was done to
eveluate the soft/hardware add-ons and extensions. To get an idea which
does its basic job better. I am sure that if one had to load e.g. 30KiB
of assembler source 20 times per hour - it would surely count (even on
the Atari) how quickly he gets his file loaded.

> Furthermore, there weren't
> too many variations of transfer speeds or hardware mods.

OK, so they were more close to each other but I still don't know how
they performed in real life. I read that the fastest, which one could
get was about 4x19200bps. This makes the teoretical transfer time
required to load a 30KiB file to be:

19200*4=76800; 76800/8=9600; 32768/9600~=3.4s

but I am sure the necessary overhead made it slower than that. The
question is "how much slower". Right now I can only wildly guess it to
be somewhere between 1.5 - 4 times the theroretical value.

> And of course,
> the faster speed was useless for most original copy-protected disks
> anyway.
>

Sure. The same here.

So do you have one, too? If yes, what are you doing with it?
The C64 part seems to work fine (NTSC) but without disc support you
only can type some small basic lines and some funny peek and pokes...
Btw, you really should buy one, as who knows for how long they will be
available! For the whole project I only hope, that the C64 disc support
will come as fast as possible.

> > CPC
> Hmm. I don't remember that as a popular or brilliant machine.
The Amstrad CPC came later (1984) than the C64, was quite faster (2-3
times) and had a much more modern architecture (FDC, Z80 etc...). It
was a brilliant machine (screen resolution of up to 768x270, fastes
floppy for 8bit machines etc) but not popular, because the C64 came
earlier and had better capabilities for many type of games (SID sound
and hardware sprites).

This gets better. I may be interested in one of these - but would I be right in saying that the DivIDE (Speccy expansion bus IDE interface and programmable ROM) would not be compatible? Or does the C1 provide the speccy expansion port too?

Must have a look at the specs.

D.

Well, i'd hope that they read what ends up in their inbox. Anyhow, I'd
certainly not class this as SPAM, as it spans the whole 8bit range (or the
more popular models anyhow). I'd be interested in one of these for obvious
reasons :)

My first goal is to make a TurboCPC with two switchable Modes: Turbo Mode -
so fast as possible and Clone Mode - so compatible as possible. A second
goal could bee a hires Mode or more memory. I have some Ideas but no special
plans. I will wait for the feedback of the TurboCPC.

I don't know the DivIDE. The CPC has a Symbiface IDE Interface. The C-One
has only Ports from the C64 on Board. But it sould bee possible to make
adapters for other 8bit computers.

From: carmel_andrews@hotmail.com
Message-ID: <6912483e.0502010457.634432fb@posting.google.com>
Source record: 12765

The reason for the commodore (vic20/c64 etc) and atari 8bit line being so similar so far as hardware technology is concerned is because, according to my contact with one of the principles behind one of the better kknown atari related websites, they said/stated that they were longtime friends with one of the original main hardware designers of the vic20/c64 hardware (the designer was Bob Yannes) and Bob told this person that i was in contact with that the directive that CBM gave him was 'tear into' the atari 800 hardware and come up with a similar technology at a lower pricepoint, tear into, i guess is an engineering term for 'reverse engineering' or 'cloning' hack job etc

After all, shortly after the release of the vic 20, Atari tried to sue CBM, over CBM's use of the joystick ports

Developing the boot rom :)

P> The C64 part seems to work fine (NTSC) but without disc support you
P> only can type some small basic lines and some funny peek and
P> pokes...

But it does support diskdrives - real ones. Loading from IDE drives
will be implemented when Jeri's finished with the DTV core.

And yes, the C1 is only for early adopters right now - that's why they
are sold as beta boards. The HW is done, but the cores aren't.

P> The Amstrad CPC came later (1984) than the C64, was quite faster
P> (2-3 times)

Actually, more like 1.5-2x as fast as a 1 MHz 6502.

P> and had a much more modern architecture (FDC, Z80 etc...).

While I would agree that the CPC OS is more modern than the C64's, I'd
hesitate to do so when it comes to the hardware. It has twice the
memory bandwidth for video, but it lacks sprites and hw scroll, and
the video addressing is a bit wonky. Calling the Z80 a more modern
design than the 6502 is also a bit of a stretch - the 6502 came out in
1975, and the Z80 in 1976, but was a clone of the 8080 which came out
in 1974.

> I would be happy to know them. Both the transfer and the actual load
> speed would be perfect.

I can't tell you anything about the actual load speed, but the
raw transfer speed can be calculated if one knows the value that
is used to set the POKEY frequency.

Standard disk IO uses a factor of 40. Some drives (like the Turbo
1050, the XF551, and the IndusGT) also use this speed when transmitting
the command frame. The data frame is then transmitted in high speed.

I've looked up the value for the Turbo 1050 in the source code,
and took the other values from Jindroush's page. The value for
AtariSIO comes directly from my source code, and I'm quite sure
SIO2PC/APE also use the same value because the PC serial port
can only do 19.2/38.4/57.6 kBit/sec (9.6k and below and 115.2k
aren't useful here).

Next thing you need to know is how to calculate the exact frequency
from the POKEY value.

For PAL machines this is: 1773447 / (2*(value+7))
and for NTSC: 1789772.5 / (2*(value+7))

So, now here's the table. I hope I didn't make any mistakes
an it is correct :-)

Drive | POKEY value | PAL speed | NTSC speed
------------------------------+-------------+-----------+------------
Stock 1050 | 40 | 18866.46 | 19040.13
US-Doubler, Happy | 10 | 52160.21 | 52640.37
Speedy | 9 | 55420.22 | 55930.39
AtariSIO, APE 3x? | 8 | 59114.90 | 59659.08
Turbo 1050, IndusGT Syncromesh | 6 | 68209.50 | 68837.40

so long,

Hias

663. DGS Atari 8-bit CD-ROM - Special offer for newsgroup readers!

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-01 13:20:34 UTC

Source record: 12768

Hello All,

As you may have read from my previous postings, eBay have banned me from selling my own Atari 8-bit CD-ROM collections on eBay. This has blown a bit of a hole in my plans for this product, and the figures we worked through with the original copyright holders are now, basically, fiction! As a result of this, we have decided to try and meet targets by reducing the price for a limited period.

For the rest of this week only (until 4th Feb 2005), we have been able to reduce the cost of the full combo CD (Commercial and PD collection) down to $6 including airmail shipping. That's a $4 saving. UK buyers only may pay in Pounds, at a cost of ï¿½2. These prices are basically covering our costs only. You can pay using PayPal.

We have set up a special page just for newsgroup readers. This isn't available as a link on our main site, so go straight to the following to get the discount:

http://www.dgs.clara.net/cdrom-a8.htm

All orders will be shipped on the 5th Feb.

Dean Garraghty

I'm fighting to minimise my stuff.

> The Amstrad CPC came later (1984) than the C64,
> was quite faster (2-3 times)

My mate wrote a Z80 to 6502 translation and he said the resulting code ran
several times faster on the 6502 although had larger code.

It is possible to slow systems through poor coding.
Maybe the C64 had a slow BASIC interpreter.
If they just chucked the source through a compiler,
then I would not be surprised if it were slow.

The Atom and BBC BASIC interpreters were hand optimised and were pretty
fast, even though CPU clock rate was nothing unusual.

> CPC was a brilliant machine
> but not popular

It doesn't seem to have as big a cult as Atari/Apple/Commodore.
Amstrad is usually associated with low-quality products.

> Actually, more like 1.5-2x as fast as a 1 MHz 6502.
Hm, I don't know. I just have some values like this:
Data transfer to/from the IDE-Interface: CPC: 162KB/s, C64: 60KB/s
Floppy speed: CPC: 20KB/s, I don't know the speed on C64, but I heard
something about 9KB/s, when you use tricks.

> But it does support diskdrives - real ones.
That are good news! I didn't know it. Hope I can organize one soon to
try it.

> It has twice the memory bandwidth for video, but it
> lacks sprites and hw scroll, and the video addressing
> is a bit wonky.
The lack of hardware sprites was one of the biggest disadvantages of
the CPC, I totally agree. Maybe that was the main reason, why many
games were better on C64 than on CPC.
CPC was also able to do HW scrolling, but not many games used it. The
video addressing was a little bit complicated, but you are still able
to do very fast screen output on CPC when you know how, so that doesn't
cost any performance at the end.

> Calling the Z80 a more modern design than the 6502
> is also a bit of a stretch - the 6502 came out in
> 1975, and the Z80 in 1976, but was a clone of the
> 8080 which came out in 1974.
Well, the Z80 had many improvements comparing to the 8080.
And as a spoiled Z80 programmer I am in a shock, when I see 6502
assembler ;-) It's a little bit different, if you have 3x8Bit Registers
at all (6502) to work with, or 18x8Bit Registers (Z80), from which you
can use 16 as 8x16Bit Registers. Ok, the Z80 doesn't have a zeropage.
Regards,
Prodatron

> the boot process.

Hmm, so it has to drive the address lines of a Flash PROM.

I'm a bit short of real estate, I thought I could do this:

- small CPLD puts nop-codes on a (hard) CPU (65C02/Z80) data bus in a 16K
space.
- and routes the data to the FPGA
- CPU jumps to FPGA boot data and tries to 'run'
- CPU sees nop codes and thus increments address lines through 16K
- FPGA sees 16K of config bytes
- CPU selects next 16K page of config ROM
- Repeats until FPGA loaded

The advantage of this is that the config data sits in the same ROM as used
for 6502 firmware.

Using a hard CPU like this might avoid the cost of a separate config ROM,
and free valuable FPGA resources.

OK, here are the results of my test, reading a full 180k DD disk
(3*128 + 717*256 = 183936 bytes) with a sector copier:

Speedy 1050: 53 sec. -> 3.5kB/sec
Speedy 1050/highspeed copy: 44 sec. -> 4.2kB/sec
AtariSIO: 34 sec. -> 5.4kB/sec

Although the Speedy 1050 highspeed mode is faster than the AtariSIO
transfer mode, a lot of time is lost with track stepping (which
AtariSIO/APE/... obviously don't need to do).

so long,

Hias

This is exact only for the computer-to-drive direction. The exact xfer
speed when reading a sector/frame (drive-to-computer direction), is
determined by the drive (or the PC if emulating one). Of course they both
must be close enough or the xfer will fail. But thanks to the start/stop
bit mechanism, there is always a fair tolerance in async serial transmissions.

ACK, you are right. When testing PC-to-Atari communication I observed
that a tolerance of approximately 3.5% worked quite fine.

Furthermore it should be noted that the 1050 doesn't have a dedicated
serial I/O chip but that the serial communication is done purely in
software.

When it comes to the SIO protocol, things get even more complicated.
The SIO standard specifies several minimum and maximum times. For
example a device has up to 16 msec time to respond to a command
frame. In case the floppy doesn't have a track buffer (or if a
sector needs to be read from/written to disk or if a track seek
has to be done) the raw I/O speed becomes more and more unimportant.

so long,

Hias

Actually, Amstrad had perhaps the lowest return/repair rate on their CPC machines... Really well built, from the early 464 to the last 6128+ (I can't guarantee about the GX400; looks solid enough, but it's not very much tested...).

Simply enough, the user base was smaller.

Cheers

Thank you very much for this and the previous post. Although your test is not exactly the same what I often used to do (store and reload the 30 or 50 KiB file using a freshly formatted diskette), it now says much more. I think if I take the linear approach and come up with the result for the said 30KiB file being loaded in around nine seconds from Speedy1050 (I guess the highspeed copy mode can't be used for loading files, can it?), it won't be an order of magnitude different from what would really happen.

Absolutely. That's why, within some limits, a buffered drive upgrade will
outperform a drive with faster xfer speed, but without track buffer.

The GX4000 is a pretty robust bit of kit. The sheer number of working ones
for sale on ebay (given how few were ever sold) should be a testament to
that.

Now if someone did a GX/CPC+ core, even I might get a C-1

Yes, that may be correct indeed. I've got a perfectly working one, and
the insides of it look very nice and tidy, but I don't know about the facts.

> Now if someone did a GX/CPC+ core, even I might get a C-1

Mmm... well, not GX, since it was the same thing as the CPC+, but you're
right -if they go for a CPC why not go all the way for a CPC+? Oohhh
4096 colours, ahhhh hardware sprites, mmmmm! DMA sound! :)

You'll have to add a second or so for the directory access at the
beginning of the load procedure (usually the file will start at
sector 4 and the directory is located at sector 361, so this
means two half-disk seeks). But the magnitude is right.

Yes, the C64's disk interface is crippled, due to management insisting
on backwards compatibility with the VIC-20 :/

P> CPC was also able to do HW scrolling, but not many games used it.

Well, it can move the base of the bitmap screen, which shifts the
screen by 2 pixels at a time (if you're using 160x200), but can it do
single pixel scrolling?

P> The video addressing was a little bit complicated, but you are

P> so that doesn't cost any performance at the end.

Sure, just like the C64 can overcome the bitmap addressing using
tables, but the complete lack of a character/tile based video modes is
a huge drawback for action games. The CPC has to set 16000 bytes to
redraw the whole screen, which is a lot more than the C64's 2000.

Yes, the zeropage makes all the difference. The 6502 is minimalistic,
but quite comfortable to work with once you get used to it.

The fastest speed supported by the SIO routine in the Atari OS is
indeed ~19.2k. If you want to go higher you'll either need to use
a special SIO routine or a modified OS.

IMO one of the most elegant solutions was the Turbo 1050: If you
boot your Atari with the drive door open, a short menu was loaded
from the floppy drive which allowed you to install a small
highspeed SIO routine either in the stack area ($100) or in
page 6 ($600). This was not a complete SIO routine (which would
have used some 500 bytes), it was just a very small routine
(some 100 bytes) that was hooked into the IRQ routine of the
Atari OS and changed speed just after sending the command frame.

This method worked with most of the programs, except some copy
protected disks of course.

The maximum reliable speed you can achieve is maybe 70-80kbps
or so. This highly depends on the SIO routine (there are badly
designed routines that won't do 56kbps reliably) and on what's
going on besides SIO (eg DLIs, the Antic stealing CPU cycles
etc.).

so long,

Hias

Well,
the funny thing is that the inventor of the ATR format Nick Kennedy and
his SIO2PC program use 256 bytes in the boot sectors (sectors 1-3).
Thus, SIO2PC 180k images have a length of 184,3xx bytes, whereas most
other emulators have a length of 183,9xx bytes. Some time ago this WAS a
problem, since Atari 800 did not accept the longer ATR images (whereas
SIO2PC accepts both the longer and shorter images)... but nowadays
even Atari 800 accepts both formats, so no mor e trouble here...
-Andreas.

Well,
simply use any of the many available 2Bit or 4Bit Atari sound samplers / digitizers out there. Most of them were commercial products (now to be found at ebay), but some magazines like antic, analog, atari magazine, etc. did also have their own program listings (type-ins) and hardware-schematics to create your own sampler/digitizer. Alas, none of them would ever support as much as 16MB of memory or disk space and I guess it would be completely mad to load/save such a sound...

Think of the low quality and the time that is required to load/save such a digi sound - meaning a 16 MB digisound. Better stay with sounds shorter than 128kbytes... -Andreas.

> obvious reasons :)

That is something we can agree about. Although the C-One started as a C64
project, it has become much more than that. Other 6502 groups, such as Apple
and Atari, became interested early in the life of the project. Now, with Z80
cores being developed it really is becoming a universal 8-bit project.

A step in the right direction, at least. ;-) Perhaps someday a C128
core will become a reality for the C=1.

Well,
it is just because the Atari OS does not allow 256 bytes for the boot sectors (they must be 128 Bytes, otherwise: BOOT Error), that the drive has to emulate 128 Bytes allthough the sectors are 256 bytes. But, the problem for the emulators is HOW to emulate this. The floppy drive just does not send more than 128 bytes and then moves to the next sector.

Many emulators handle that differently... -Andreas.

Eh, by cross-posting you're foisting the topic on everyone, welcomed or not.
If the C-One is that popular, someone should create a new group.

Umm, you'll find that the FPGA probably requires a serial bitstream to configure. So you'd have to at least have a state machine in a CPLD that bit-bashes the config pins on the device.

And if you're planning on storing the config image in a flash rom, you'll need to drive the flash addressing without a large pin count on your cpld (say, a counter?!?).

Of course Altera have flash-based config devices especially for this purpose, but they're expensive and programmed via JTAG.

No problem, but not essential.

The Xilinx chip I use can be configured by a stream of bytes.

> And if you're planning on storing the config image in a flash ROM, you'll
> need to drive the flash addressing without a large pin count on your CPLD
> (say, a counter?!?).

When configuring, the CPU provides the sequence of flash addresses.

If I ever want to change the flash contents, I just boot up the system and
tell the CPU to reprogram the flash ROM.

That's how I managed to program my flash ROM without a programmer.
I loaded my FPGA (via JTAG) with a minimal system and BASIC ROM in the FPGA.
Then I just downloaded a BASIC program to program the Flash.

Cute trick huh?

> Of course Altera have flash-based config devices especially for this

JTAG is no problem.

> "Electrical Engineers do it with less resistance!"

Mechanical engineers find women with the most streamlined bodies put up the
most resistance.

On Tue, 01 Feb 2005 22:21:32 +0100, Andreas Magenheimer wrote:
> the funny thing is that the inventor of the ATR format Nick Kennedy and
> his SIO2PC program use 256 bytes in the boot sectors (sectors 1-3).

I also thought this was the case at first sight, but actually this is
just a small bug in SIO2PC:

The first three sectors are stored with 128 bytes each, but somehow 384
(random) bytes are appended at the end of the ATR image.

If you have a look at the SIO2PC documentation by Nick Kennedy
(file readme.txt, lines 586-593), you'll find the following:

---- 8< -------- 8< -------- 8< -------- 8< -------- 8< -------- 8< ----
You could compute some standard sizes like this:

Number of Sectors = (#TRACKS * #SIDES * # SECTORS/TRACK)

Size in Bytes = (Number of Sectors) * (#Bytes/Sector)

(For the Size in Bytes, subtract 384 for double density, because the first 3
sectors are always 128 bytes.)
---- 8< -------- 8< -------- 8< -------- 8< -------- 8< -------- 8< ----

So, to put this discussion to an end: A program which
creates/accesses/... an ATR image in such a way that the first three
sectors are stored with 256 bytes each is broken and needs to be fixed.

so long,

Hias

> means two half-disk seeks).

I see. That has to take longer than half a second. The CBM DOS stores
the files closest to the directory first thus in case of the first file
on the freshly formatted diskette it is only one track away from directory.

> But the magnitude is right.

That's what I wanted to know. Thank you once more.

696. SpartaDos 3.x manual..

Looking to emulate some of my SDX functionality in SpartaDos 3.3c..

Specifically:

Want to set a custom PROMPT at bootup, set environment variables for batch files, etc.

I have all that working great in SDX, but only have a SpartaDos construction & toolkit manual.

If you know how, or can point me to an online manual, I'd appreciate it.

I don't think this is true. The C-128 was just the next iteration of Commodore
8-bit computers. The IIgs was a 16-bit computer. Wasn't the IIgs closer to
the price of an Amiga than a C-128? The IIgs, Amiga and ST were always grouped
together when it game to entertainment software.

Apple had the right idea with the IIgs though. It was a 16-bit successor to
an 8-bit computer that maintained 100% backwards compatability.

I don't make the definition of bits - after all, MSX also evolved from Z80 to R-series - but of applications. The IIgs was the next generation of Apple II, the C128 was the next generation (at the time) of the VIC/C64 etc. lines. It's not like Commodore hadn't experimented with other CPUs, so if they chose to screw up (a little) with this stage, it's kind of inexcusable ;)

Yes, the IIgs was closer to the price of an Amiga - well, I think at launch they fall nearly between 128D and Amiga 1000 price levels - but the Apple //e was also considerably more expensive than an Atari 800 or C64. That's just Apple pricing.

> The IIgs, Amiga and ST were always grouped
> together when it game to entertainment software.

IIgs software never sold in the UK, really - you never found Apple software in stores.

> Apple had the right idea with the IIgs though. It was a 16-bit successor to
> an 8-bit computer that maintained 100% backwards compatability.

It's a damn good machine. If they hadn't crippled the CPU speed (myth) or had bothered to upgrade the CPU speed as the system evolved (reality), it could have gone on to be a nice alternative system. That market died, though - the LCII was targetted at the low-cost Apple market, hence the //e card, and so the 15-channel sound, 4096 colours and fantastic GS/OS and AppleWorks GS were lost forever.

I mean, I was joking about it being the right answer for Atari vs. C64 - the correct answer there would be "Enterprise 128" - an expandable (can handle 4Mb RAM) Z80-based 8 bit from the UK that was to sell for ï¿½200-300 (priced closer to a Spectrum than a C64 at launch) with soft video modes (672 x 512 max res, 256 colours, but not in that mode obviously), 4 channel stereo sound... and so forth.

Except being British, they screwed up making it, screwed up marketing it, and in the end the last ones went to give Hungarians a taste of what could have been whilst in the UK the C64 continued to offend shoppers until 1992, the Atari XE:VGS having been justifiably put to death officialy 2 years previously, but still hanging around stores right up to the point where the Jaguar came out.

And in classic Atari style, 3 years ago, I bought a brand new Jaguar. One of the computer game chain stores was saturated with new Lynx and Jaguar consoles and games around 2002. Systems which died far, far earlier in theory.

Larry, I have that issue and yes, it is December '83. The article is typical of the stuff written by Dave Small in that it is reasonably in-depth and technical and also, as with everything Dave did it seems, also credited to Sandy Small.

The review's conclusion is that the ATR8000 is a fine piece of kit and Dave suggests it is, in fact, the only real turnkey system he's seen. There are some (small) pictures of the interior showing the various boards.

Is there anything specific you need to know?

Regards
Jerry

For those that feel this is off-topic for the various groups I posted to, there is a C-One Yahoo group with a message forum here:

http://groups.yahoo.com/group/CommodoreOne/

But it is highly moderated and posts that get through are rather slow to make it into the forums. At any rate I should have posted a direct article link to the C-One article that I started this thread talking about, rather than a site mainpage link, as the article will roll off. Here's a direct article link to that C-One article:

http://www.bytecellar.com/archives/000036.php

Cheers. I also have a C-One area in my message forums - but they are going under graphical redesign so they look pretty generic at the moment, but are fully functional. FYI.

704. SPO256A Speech Synthesizer

Newsgroup: comp.sys.atari.8bit

Years ago there was an issue of Analog magazine that featured a build your own voice synthesizer for the 8bits. It used the SPO256A Ti Chip and plugged directly into the joystick ports.

Does any one have by chance have those schematics? I would love to build another one to replace the one I lost so many years ago. Thanks in advance.

Here are 2 articles (1 Antic, 1 Analog):

- Talk is Cheap by Ed Stewart, Antic Volume 2 Number 4, July 1983,
pages 64-66; hardware schematics only (a test/demo program is
mentioned in the text, but not printed in the magazine!);

- Cheap-Talk by Lee Brilliant, Analog Computing, issue 29, April 1985,
pages 59-67; hardware schematics and software demos, for example
"First Words");

I will check when I get home to see if I have the Analog issue above.
Maybe someone else here has the schematics, or can point you to them.
If not, I can scan them (provided that I have this issue).

All,

I have *mostly* completed my game, JellyBeans. The networking code
needs to be debugged, but the one-player only mode works great.

If you would like to give it a try or looking for more information,
check it out here:
http://geocities.com/vlastaar/jellybeans

C ya,
Chris

Nice game, difficult but very nice.

My CTIA equipped 800 has never shown this many colors! How did you get
so many? It seems like you have more than 5 colors per scan line. Or
is that an optical illusion? artifacting?

Well, I felt few are aware of the C-One and all the groups that I posted to could benefit from it. It didn't seem untoward. I am just trying to spread the word. I don't profit from this. (My site, ByteCellar, that hosts the original story makes $1 / month - I have no illusion that it could do much better! I have other sites that fill that need.)

I would buy a C-One if there was an
Apple IIe core.

Is anyone working on this?

All I need is HGR and Text screen display,
and for the associated softswitches to work.

Rich

This troll seems to be trying to flood the is.matur group with replies to his inflammatory posts.

If you must feed this troll, give him indigestion by removing is.matur from list of groups crossposted to.

Please don't leave in a huff. Sadly, the state of spam abuse lately has made cross-posting a liability. I inferred you were just trying to spread the word. The Yahoo group had moderation turned on recently, due to the flame wars erupting on it.

To stay on topic, it seems there are folks looking into a Apple II (not sure what variant) option, but I don't know of any Atari or Sinclair work. Both should be doable. I know the designer is an Atari fan (and was approached to do the Flashback, but InfoGrames (or whatever their name is) didn;t think she could pull it off. She was interested in an Atari version of the idea that became the C64DTV (Commodore 64 30-in-1 Joystick unit). The opportunity may have passed though, as she's in demand now, and redoing a 80's platform in FPGA costs a lot if you count all the hours up. The DTV happened mainly because the core had mostly been developed in "hobby time", which didn't have to be paid for by the manufacturers. The Apple line was elegant in it's simplicity, but the Atari custom ICs I would assume are not trivial to re-implement.

Not true. I use .D64 images with my real C64 more often than I use a real
floppy disk, Nick Coplins 64HDD program allows this. Maurice Randall has
also said that CMD HD DOS+ will also support mounting of D64 images too.

>Although .d64 images can be used directly on a _software_ C64 emulator, the
>fact that they can not be used directly on a _hardware_ C64 emulator is an

>the software emulators.

Vice seems to handle this situation very well, if the C1 C64 core can have
the same level of compatability then we should all be happy.

Not to the original layout, though for a "slightly modified and
improved"(tm) version that connected to the parallel port of the XL
series. It used an additional VIA chip to address the SPO256AL2 and
feed the speach back into the audio out of the system. If you need the
schematics, I think I might still have them somewhere as a GIF. Back
then I also sent them to ABBUC (IIRC), so they might have them at
their pages as well.

So long,
Thomas

The C1 is not an emulator. If you want to use D64s, you'll have to use
64HDD just like on a real C64.

I've followed this project with interest for a couple of years. It is clearly a superb technical achievement, and I'll probably buy one after it is a released product. But I do have a difficult time understanding how the C-One is functionally anything other than another emulator? Is there something that it can do that well-executed emulator(s) can't do on a PC platform? Perhaps I'm missing something here (and I'm sure someone can enlighten me. :-)?

> My CTIA equipped 800 has never shown this many colors! How did
> you get so many? It seems like you have more than 5 colors per
> scan line. Or is that an optical illusion? artifacting?

It is not an optical illusion and it is not artifacting. I am using Priority Zero CTIA/GTIA mode. In this mode Players 1/2 will be ORed with Playfield 1/2 and Players 3/4 will be Ored with Playfield 3/4. If you turn on the "Players generated third color" bit, the players will mix with each other.

JellyBeans shows a maximum of 12 color changes per line, even on a CTIA. I then use DLIs to change brightness every line, so 90 colors are possible on screen at one time.

Interestingly enough, I found that it is possible to have 24 different colors on one line at a time with Priority zero mode without interlacing - you just cannot have the colors everywhere on screen. If you mess with the color registers and/or the horizontal position registers during the scan line, it may be possible to generate more colors...

The FPGA's on the motherboard are loaded with a core file that
describes an actual hardware configuration that the FPGA's take on.
With this technology, it is possible to create a clock-perfect replica
of a target platform (not that all the cores out there right now are
clock perfect). Regardless of the machine it is running on, all
software emulators have some degree of latency that "breaks the spell"
of trying to experience _perfect_ emulation.

I am primarily interested in the C64 core and while it seems to to a
pretty good job right now, it's not at 100% (yet). Read more about
FPGA's here, to grasp it:

http://en.wikipedia.org/wiki/FPGA
(though Wiki has been slow lately)

L> functionally anything other than another emulator?

From a user's perspective, there's not a huge difference, both allow
you to use different platforms with the same keyboard and monitor.
Under the hood there's a huge difference. An emulator looks at the
program code, simulates the instructions being executed, and presents
the results in a window on your PC that looks more or less like the
real deal. In an FPGA the electrons move around just like they would
in a real computer - for all intents and purposes there's an actual
6510 and VIC chip inside it. It enables you to do things like connect
actual C64 cartridges and disk drives - something an emulator can't
do. While vice allows you to load from a real 1541, it still emulates
the drive, but fetches the data from the 1541 instead of a d64 file
(correct me if I'm wrong here Spiro :).

Ahh. It's been a long time 20+ years. I forgot about the possibility
of player and playfield color combinations.

I noticed the brightness changes and assumed you used DLIs.

I became curious while waiting for your reply so I hooked up my 800 to
my old ATI All-in-Wonder (original) and used the zoom mode. Hard to
see with magnification degredation, noise and so forth but I was able
to count at least 8 colors. That was enough to know I wasn't imagining
things. LOL!

I'm impressed by how smoothly you have managed this.

I don't know how Outlook Express handles it, but I would "cancel" the
message. Generally, you open the message that you sent by mistake, then
select cancel (for example, using Pan, I'd select: Articles >> Cancel.) I
don't think you can do it if anyone has replied to your message though.

The 6502 can do more per clock cycle than a Z80 though. Also the C64 did have tiled displays, hardware scrolling and sprites, which helped a lot.

> and had a much more modern architecture (FDC, Z80 etc...).

It was a good example of a company putting a lot of off the shelf components together with a small amount of custom logic to make things work well and have a nice display, even if a lot of work was required to handle it because of its relatively large size (16KB).

Not until the CPC+, which basically fixed all the problems with the CPC
by adding smooth scrolling and hardware sprites amongst other things.

> Sure, just like the C64 can overcome the bitmap addressing using
> tables, but the complete lack of a character/tile based video modes is
> a huge drawback for action games. The CPC has to set 16000 bytes to

Yeah, a lot of the CPCs top games aren't scrollers, but flip screen, and
especially isometric which worked well with the bitmapped display. It
meant the CPC had some great graphics applications like Advanced OCP Art
Studio, and great loading screens, heh. Then the game area would be
shrunk down so they could update it at 25fps or so. Shame really, the
CPC did have smooth vertical scroll, but hardly any games that could
have benefitted from it used it.

But can you use .d64 images on your C64 _directly_ from a 1541, 1571, or 1581
drive?

Is 64HDD a real CBM drive or does it emulate a CBM drive?

Don't get me wrong... I think 64HDD is a good thing for the Commodore
community, and certainly one good solution to the mass storage problem.
And, I appreciate all the long hours and hard work Nick put in to make 64HDD
happen.

Indeed, he does say it works great... It had no problem setting DD, ED and SD on my XF551. It also read the current density setting of the drive with no problem. It doesn't include any double sided settings, just FYI.

Now I'm trying out the XF551 with a Hyper-X upgrade ROM chip. I'm running into an interesting issue, but the drive changes density much better with this ROM chip.

Here:
http://geocities.com/vlastaar/a8ether/

Chris' effort seems to be the current state of the art for Contiki on the
Atari 8-bit. I think the next big problem is going to be memory. The
Atari has quite a bit less free than the C64.

i dont think anyone has a commodore 64 without owning an atari of some sort

my system list looks like this
atari2600
atari5200
nintendo nes
commodore64
sega genesis
pcclone 386
gameboy
atari lynx
super nes
pcclone486
pcclonepentium90
pcclone amdk6200mhz
gamecom (kbtoys closeout)
gameboy color
pentium 400mhz
pentium 1.6ghz

and my garage has all these thing in boxes

i pity the fool that has to deal with my crap when i die

LOL! I love these topics.

This is difficult to say since I wasn't into that sort of thing back when C=64 users and Atari users were more prominent.

However, for the interest of science I would be willing to be the Atari User test subject to try this with some nubile blond (etc etc) C=64 user.

It's a difficult job... I know... but don't weep for me. Know I bravely volunteer for the hours and hours of experimenting that will be required. Heck, probably days to iron out the equation.

(Ahem... and yes, I should mention nubile blond FEMALE. Well, brings up an interesting question of how many models out there used a C=64. Bo Derek? Farrah Faccett? Taaffe O'Oconnell?

I bet Phoebe Kates from the Gremlins and Fast Times at Ridgemount High movies used a C=64.) LOL!

Yes... science! ;) (Music from "Blinded Me With Science" playing in background.)

Brought Contiki up a time or two. I can say from the Atari 800 side of the
house that the telnet came up fine (as fine as things went without having a
working ethernet module), the web browser never loaded for me... yet. And
I tried that one on the 800 and a 256K 800xl. Both claimed to not have
enough memory.

> and my garage has all these thing in boxes

> i pity the fool that has to deal with my crap when i die

Take your list, substitute any PC with a Mac era equivalent, and the list
is about the same. :)

I am working to weed out my collection as I go, but I just seem to be
replacing non Atari stuff with Atari stuff.

And about dying.. well... I've tried writing it into my will that should I
die my Atari stuff will be donated to the Atari 8-bit newsgroup to pass it
on, but we will see how that goes.

Honestly, it is funny to think about it. I mean, we really are the glue
that holds our stuff together and give it significiance. I saw a
collection of electronics parts and things that had been assembled by a man
who had passed away and everything was being sold by the dollar at the
First Saturday Sidewalk Sale here in Dallas. It was interesting how
everyone looked at the stuff saying "Huh?" And after we all go, that is
how our stuff will be treated.

Getting too deep... getting back to my resolution... must play another
180,000 point game of Wizard of Wor. ;)

I told my wife about my willingness to volunteer for the scientific cause of finding out if sex between Commodore Users and Atari Users was possible and she got a good laugh out of it.

She suggested that we should have have like the classic and hot rod car magazines where you see the car and a model in a swimsuit (or other arrangement) :)

So classic computers with some model standing nearby it. I like my wife's thinking. :D

No, there is actually no drive emulation involved: VICE traps calls to
the IEC kernal routines (LISTEN, TALK, etc.) and calls the corresponding
driver function in cbm4{linux,win}, so it is really an emulated C64
talking to a 1541 (or any other device) ;-)

I use .d64 images on my C64 and 1541 easily, by making the images into real
disks and back again with my PC. I have one (1) floppy disk that I use
regularily any more, and its only purpose is to temporarily hold .d64
images. The point is, the lines have become blurred.

> Is 64HDD a real CBM drive or does it emulate a CBM drive?

What do you mean by 'real'? You could say that about any third-party device
(CMD, MSD, etc...) that it isn't a real CBM drive, it's just emulating one.
CMD drives aren't real CBM drives, but they run software that talks the CBM
serial protocol and store the data in CBM-friendly format.

So by that definition, 64HDD is as much a CBM drive as any other third-party
peripheral.

Maybe this is a stupid question, but while the 800 has quite a bit less free memory than the C64, what about the 130XE and XLs with pumped-up RAM? Why can't Contiki run on those?

I'm looking at doing Contiki with an actual 850 and a WiBox rather than an Ethernet cartridge - my cartridge slot is full - so I'll have to ask Chris whether his 1.1 port requires his Ethernet solution or whether it works over R: - unless someone here knows.

According to the author, yes it works. I have gotten it to load on a 130XE
that was not actually connected to the Net. This version needs the 850
interface. I was told another version was coming out that did not need this.

I've made a few disks from images using the special cable and only
the 1541 drive connected to my PC, but there is supposed to be
a type of server in the software package that allows you to connect
the C64 directly and load the D64 images. Am I wrong? I have yet
to try it this way. My space is limited and I just can't have 3-4 vintage
machines connected to my PC at the same time or I would have by now.
If anyone has insight into this, I'd appreciate hearing what they've been
capable of accomplishing.

>

There is no reason that the 130XE couldn't run more Contiki
Applications other than I have limited time to work on Contiki. :(

I did run out of RAM to make the Web browser work on version 1.1, but
there is no reason that more tricks couldn't be done like turn the OS
off and use memory under the OS ROM for the XL version. The CS8900a
driver doesn't use the OS and I have written simple screen and keyboard
drivers that do not use the OS for JellyBeans, so it is possible to do
all sorts of things. In fact, the JellyBeans screen/character set
could be used for a 4 color mode GUI, but this would of course take
more RAM...

I am sorry that Contiki and the EtherCart are not widely available at
the moment, but with work, a new daughter, and all sorts of
time-sucking things on my hands at the moment, Contiki development on
the Atari has stalled. BUT, what I can say is that it IS possible to
run Contiki without many packet drops and it should be possible to have
the web browser working with a little bit more software debug work. I
have posted my source code, and the hardware schematics, so anyone can
work on the project.

I wish I had more time, but of course if some one would pay me $80+k a
year to develop Atari hardware and/or software I would quit my job in a
second. *sigh* but this is the real world. I have several other Atari
Hardware projects that I have started, including a full Verilog
representation of an 800XL (maybe for use in the C-one), and an FPGA
device to plug into the PBI port that acts like an ANTIC/GTIA with VGA
outputs, BUT.... none are complete. :(

What I can say is that I know new Atari hardware will come in the
future...!!!! There is always something new, just look at the USB
Cart. I find it interesting that some people always say at the
beginning that it is impossible to connect this or that to the Atari
because it doesn't have enough processing power, data bus, etc to do
Ethernet, USB, VGA, etc. But, if you wait, programmable logic prices
come down, software development tools become better, and before you
know it, it is possible to do these things. What I have learned from
the hardware design industry is that it is always possible to push data
from one device to another, it is just a matter of how much hardware is

needed to do it. There is a solution to anything as long as you do not violate the laws of physics, but even that is debatable! :) (Did someone see a small soapbox around here somewhere... :)

Cheers,
Chris

OK, so the SIO commands 78 and 79 are standard. I just never saw a program
that used them. I don't know where I found them, maybe a SpartaDOS manual,
or my RANA manual. They aren't in 'Mapping the Atari' for SIO. I find that
the 78 command doesn't seem to work exactly, but the 79 does work fairly
reliably. I just tested on RANA and US Dblr 1050.

Funny, I was just wondering that myself while perusing my collection,
today in fact.

The last issue that I own is number 45, dated August 1986. Issue
number 1 is dated January/February 1981. I'm missing numbers 27 and
40-44.

By the way, A.N.A.L.O.G. became ANALOG Computing after just 6 issues.

My newest (latest?) issue is #77 - Oct 1989.

I'm missing issues 1-13.

I believe that A.N.A.L.O.G went from bi-monthly (every-other-month) to
monthly starting with issue #15 - Jan 1984

Between Issue #18 - Apr 1984 and Issue #19 - Jun 1984, there is not a
May issue.

Issue #56 was a combo Jul/Aug 1987

Between Issue #58 - Oct 1987 and Issue #59 - Apr 1988, there were no
issues.
This is a 5-month gap.

If anyone is willing to part with one or more of the first 13 issues,
drop me a line.

I'm also interested in the answer to the original post about the last
issue published. Thanks

Thanks for clarifying... This answers the question you asked earlier on in the thread that I was far too dumb to answer. (That was you, no?) By asking initially you did send me down a path whre I've learned a bit about this stuff, and I appreciate that.

Complete List of ANALOG magazines

Atari News and Lots of Games.
ANALOG published 79 8-bit magazines. They also published
'The 8-bit Extra' and 'The ANALOG Compendium' books. The
first issues were about bi-monthly. The first issue was
1-2/81. The last issue, #79, was 12/89. Starting with
issue #15, ANALOG became monthly. There were no dates put
on the covers of issues #4 to #11. ANALOG missed a month
5/84. In 1988, ANALOG Inc. was bought by Larry Flint
Publishing (LFP) and Mike Deschenes was no longer listed as
co-publisher with Lee Papas. ANALOG/LFP also published an
ST magazine called ST-Log in the later years (about '87 to
'90).

List of ANALOGS:
#1 - 1-2/81
#2 - 3-4/81
#3 - 5-6-7/81
#4 - 8-9-10/81
#5 - 11-12-1/81-82
#6 - 2-3-4/82
#7 - 5-6-7/82
#8 - 8-9/82
#9 - 10-11-12/82
#10 - 1-2/83
#11 - 3-4-5/83
#12 - 7-8/83
#13 - 9-10/83
#14 - 11-12/83
Issue #15 starts monthly publication of ANALOG. The first
14 issues took 34 months.
#15 to #18 (1/84 to 4/84).
#19 was 6/84, no 5/84. Two month issue
#19 to #25 (6/84 to 12/84)
#26 to #37 (1-12/85)
#38 to #49 (1-12/86)
#50 to #55 (1-6/87)
#56 7-8/87, two month issue
#57 9/87
#58 10/87
Then there was a 6 month hiatus, from 11/87 to 3/88 when no
ANALOGS were published. Larry Flint Publishing bought
ANALOG (LFP).
#59 to #67, 4/88 to 12/88

#68 to #79, 1/89 to 12/89
#79 was the last issue of ANALOG. Subscribers were then
transferred to Antic.

Russ Gilbert
(and I also have this)....
A little history:
ANALOG published their first issue 1-2/81 (#1) and their
last issue was 12/89 (#79). They were supposed to be
bi-monthly at first, but were more like tri-monthly, taking
3 years to publish the first 14 issues. The months were not
put on the cover of most of the first 14 issues. Then,
beginning 1/84 (issue #15), they went monthly for 45 months
until 10/87 (#58). There were 44 issues during that 45 month
period. Then, from 10/87 to 3/88 there was a six month gap.
LFP bought them and published monthly for 21 issues
beginning 4/88 (#59) until the last issue #79 12/89. ANALOG
then 'sold' or 'gave' their subscribers to Antic for an
'equivalent' number of remaining magazines. I'd like to
know who now owns the rights to ANALOG.

Antic started 4/82 (Vol. 1 No. 1) and was bi-monthly for
the first year, until Vol. 2 No. 1 (4/83), when they went
monthly. Antic published monthly pretty regularly until 9/89
and went bi-monthly from 10-11/89 to 6-7/90 (Vol. 9 #2, last
issue of separate Antic.) Antic was then put as a
department in STart for four months and then STart published
their last two combined ST and 8-bit magazines 2-3/91 and
4-5/91, which was the last issue of both Antic and STart.
There were about 94 Antics, including the Antic section of
STarts.

Finally, I recently saw a ANALOG issue #1 go for about $44.00
on ebaY, a little steep for me. I lack #1, #3, #4, and only have a copy of
#5.have #2 and a copy of #5. I have all issues of Antic.
But I ramble.

I looked at the Contiki system and I think it would also be possible to swap in extended memory in the dispatcher module to get around the low memory problem on the Atari. As far as I could see, the only things that need be in main ram are the dispatcher, the gui modules and of course screen ram.

It seems that it would be fairly trivial to code some small wrappers that switch in the proper bank of memory when an application's event handler is called from the dispatcher.

I haven't had time to go further into myself either, and it seemed you had it well in hand. The new version of Contiki uses loadable modules which may be a way around this problem too.

Sorry, no can do... XIO is the Basic command to perform CIO functions
thru a device handler such as DOS or RS232 defined in HATABS and
giving the necessary support.

The Resident Disk Handler and the device control block are at the SIO level;
you must declare a buffer address and size plus the data direction and
device
code and number before calling the SIO vector.

No you can't mount a .d64 file from a 1541/71/81 and whether 64hdd is a
real drive or emulation wasn't being questioned, I was simply replying that
some of us do use .d64 images directly on a real c64 thanks to the magic of
Nick Coplin.

Doubtful dunny, after all, it's a different cpu, and the speccy expansion
slot was just most of the z80 pins with a few extra lines for power and
other stuff

While the initial issues of Analog were obviously very important,
there is little of substance (IMO) in the first three issues. By
issue five, the "form" of Analog had been fleshed out, and it was well
on its way to being the premiere English language Atari (print)
magazine. My first "newsstand" issue was #9 -- I couldn't believe how
much good "techie" stuff there was in it!

...And speaking of Analog, does anyone know if the "Digital Analog
Project" is still active?

You can find a short explanation of these commands on Jindroush's Atari
pages: http://www2.asw.cz/~kubecj/asio.htm

IIRC these two commands were introduced by Percom and were therefore
calld "get/set" percom block. Early Atari drives like the 810 and 1050
don't support these commands, but most of the floppy enhancements and
third party drives, and also the XF551, support them.

The drive configuration consists of 12 bytes, most of them (like
bytes per sector, sectors per track, etc.) are quite obvious
(just note that the number of sides is decremented by one, so
0 means 1 side, 1 means 2 sides, ...), but there are also some
drive specific bytes which can/should not be modified (the last
4 bytes of the config block, and be also careful with the stepping
rate).

So, what you basically do to set the drive configuration is first
read out the current config, then modify the bytes you need, and
then send the new configuration to the drive. Now you can use
the SIO format command $21 to format a disk in the chosen
density/size.

This method is compatible with all drives since the
"unknown/drive specific" bytes are all kept at their default values.

Another note, as already mentioned earlier in this thread: at
least for the XF551 you have to read sector number 4 before reading
the drive config, otherwise it won't be correct.

so long,

Hias

Thanks Steve, I got it working here now - I didn't realize that I needed
to keep on pressing enter right after "unset binary".

Also, here, keypressess are not echoed back.

Works though, thanks again! :-)

Hey,
Everyboady knows Apple II has fastest drive access, commodore has the slowest access, and Atari is in the middle.
With the mods that we find online like parallel enhancement that can be made to commodore drives, high speed routines for apples, and plug-in boards for the Atari then who is the fastest and who is the slowest?

If you intend this to be more than a crossposted troll, you will have
to be much more specific about the kinds of disk operations being
compared (BASIC LOAD/SAVE, binary LOAD/SAVE, etc.) and the kinds of
disks being used (5.25", 3.5", hard drive).

For the Apple II, there were several operating systems and each one
had its own file system. Further, a re-SAVE will, in general, take
less time than an initial SAVE.

Hello!
I saw this auction on Ebay
http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&category=62054&item=8167936793&rd=1#ebayphotohosting

and noticed this includes an IBM external 3.5' floppy drive.

Was there some hack/mod out there that would allow such a thing to
work with the atari 8-bit computers?

Or is it a possibility that it just wound up in the same box as the
Atari and the auction house simply included it???

Just wondering...

Michael Brigham

If a long transfer is done with DMA, bus speed is an issue--otherwise
there are lots of software and protocol variations that can swamp
bus speed.

Put another way, if your system can come close to sustaining disk
data transfers at bus speed, then you have a _very_ fast storage
system!

IIRC the clock of the Atari is indeed nominally higher (ca. 1,78 MHz)
than both the "standard" Apple or a C64 but it is enormously slowed by
the DMA of the screen controller ('ANTIC'), which can halt the cpu at
"will".

I have no exact numbers but I read something about an effective clock
of 0.9-1.0 mhz - in other words: Picture generation eats half the cpu
time thus making it theoretically comparable to the other systems.

It's not an XF-551 is it? You can see the unit in one of the pictures:

http://www.packratauctions.com/gd-lot_(9).jpg

I'm not sure if that's an XF-551 because I never owned one, but maybe
someone could tell you. Great system there though.

It can't, at least not a stock drive. The most important reason is that the sector size is different, 512 bytes on the PC vs. 128 or 256 on Atari disks. I'm not sure if a custom firmware would be enough or you'll need more RAM (don't recall the XF-551 internals). You need more memory to read bigger sectors.

Most 1050 enhancements, such as the Happy, can read/write single sided PC disks. But there is an issue of the different RPM (rotational speed). It is 288 RPM on Atari and 300 RPM on the PC. So unless you modify the 1050 speed, this it is not very reliable. YMMV.

The RPM issue affects the XF-551 as well. Even when the XF-551 RPM is the same as the PC one, the FDC is clocked faster to compensate. So the FDC still gets the data at the wrong rate.

My guess is it just ended up in the same lot, like the monitor base sitting against the wall.

There were solutions available to hook up IBM-type disk drives, The BlackBox being the one I remember, but I don't see one of those in this lot.

The XF551 also could be mod-ed to hold a 3.5" disk, but there isn't one in this lot.

A curious design choice, in view of the beautiful pecliarity of the
6502 that it accesses RAM on only one phase of the clock, making
zero-interference video DMA trivial (as in the Apple). Of course,
if the ANTIC would otherwise interfere with the video refresh accesses
(in the visible part of the raster), then interfering with the CPU is
the easiest course.

That squares with my informal 1980 benchmarks at the local Computerland.

I would agree. Looks like an ST based floppy drive.. just something mixed
into the collection. I have an XF551 with dual 3.5 inch drives. It takes
modification to get that functionality, but only at 720k, instead of
1.44mb (mine at least).

802. Third edition of Atari-Day in Dordrecht, be there!

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-06 22:49:51 UTC
From: "Ernest R. Schreurs" <ernest@wxs.nl>
Message-ID: <536d01pf8e10tms5fi2ijpthoc9e8p18vr@4ax.com>
Source record: 12707
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

On sunday the 13th of february 2005, the third edition of the Dutch
Atari day will be organized again in Dordrecht, The Netherlands.
The location is the Titus Brandsma-Stedelijk Dalton Lyceum.
Kapteynweg 3
3318 EC Dordrecht
The Netherlands
The event will be held from 10:30 am until 16:30. Admission
is free. It will be organized by Jos Vlietstra, just like the
previous two years. This is an event that we have grown to like a
lot, and if you like Atari, you will want to be there, maybe buy some
things, or just watch some of the MIDI demonstrations.
If you wish to participate contact Jos Vlietstra by E-mail. You can
mail him at this address: jo.vlie*at* hccnet.nl
Of course replace the *at* by the @-sign.
Everyone should bring their own sandwiches and drinks, since there is
no place to buy these close by.

Directions:
By train: go to the station Dordrecht Zuid.
Walk on the left side of the S. van Gijnweg towards the Sterrenburg
district. After 5 minutes, you can see the back of the school. Turn
left walking on the pink Steve Biko bicycle path and follow the green
fence until you reach a gate after about five minutes.
By car: from Rotterdam take the left tube of the Drechttunnel.
Then take exit Papendrecht immediately after the tunnel. At the
traffic lights go straight for a short while, then take a right turn
onto the Laan der Verenigde Naties. At the next traffic lights go
straight on, passing the Shell pump, then take a right turn at the
next traffic light. Follow the road straight on, passing the traffic
lights, take the railroad tunnel then make sure to be in the left
lane.
Take a left onto the kapteynweg and take a left again and park.
Take the pink bicycle path again and find the gate as above.
If coming from the south, follow direction Dordrecht, take the exit
Centrum, take a right onto the Laan der Verenigde Naties and follow
the directions above.

Attention: The front of the school will be closed! Do not be alarmed,
the entrance to this event is on the back.
See you all there!

Commodore with 1541 and Professional or Prologic DOS would possibly be
even faster. AFAIR the order of speed (immediately after power-up) was:

1. Professional DOS
2. Prologic DOS
3. Dolphin DOS.

All three were fast enough to smoke the rest of the possible competition
out though.

I would also be interested in how the fastest Apple][floppy rigs performed.

As for the Ataris I am already enlightened a bit. ;-)

Hi all, need help with an 800xl. I recently was given a slighty dead 800xl, and I am wondering what could be wrong with it. It is failing in the rom test, and this diagnostic program runs as soon as the 800xl is powered up. Also, it only shows 40 blocks in the ram test, not the normal 48. Both roms show red.

I have removed and reseated the chips which could be removed. Also, if a cartridge is installed, it plays well. It is a Rev D mother board, and seems like it has never been in for repair.

Any ideas?

Also, can anyone send some links for some general info on using the 8-bits. Little things like formatting disks, getting a directory and such. Even better if someone knows of a 1050 drive manual that is either online or downloadable.

I am quite new to the Atari's, and I need all the help I can get! LOL!

Thanks!

Michael Brigham

Video does eat up a lot of cycles but I think the 40x24 text display
uses up less than a third even on NTSC systems. Most displays wouldn't
use much more than that. The worst case scenario probably is around
half though.

806. question on adding drivers to OS

My DOS-XL manual has a lot of info on this but there is one thing I haven't figured out.

Let's say I have a driver called "W:" and a program calls the OS wanting to write 10,000 bytes to "W:" The driver can look in the IOCB to find the address of the data and then do the whole transfer the first time it is called (faster this way). But how do I get the OS to NOT call the driver 9,999 more times afterward?

With this driver I wrote I can type in COPY D:SOUND.RAW W: at the command line (in SpartaDOS it seems you also need a dummy filename after the W:) and it will play 15KHz 4-bit PCM sound but after it is done there is a long pause before the prompt returns (presumably because of the above issue)

Actually standard text screen (OS mode 0) is the worst case. This is because text screen on the Atari is bitmapped from the point of view of DMA. The "font" is always stored on main RAM. So ANTIC has to fetch the characters bitmaps, same amount of bytes as the highest graphics mode, *plus* the characters themselves. At a standard text screen, ANTIC steals 36% of CPU cycles on NTSC.

The best case is, of course, nothing (blank screen without DMA). But even then ANTIC steals some cycles for RAM refresh.

Forgot to add that a custom text screen might steal even some more. More lines, wide screen, etc. And for the worst case you have to consider player-missiles DMA as well.

You can modify the xfer length before returning to the OS. You have to do
it at the z-page copy of the IOCB data that starts at $20. Not at the
specific IOCB at $340,X. So you have to modify the word at $28-$29. I
don't remember if you have to set it to zero or one (try both :)

But this is a bit tricky. In theory a user program can call your driver
directly bypassing CIO. And then the z-page IOCB would not be set.

Every DOS performs this "trick", it is called burst I/O. They normally
have some restrictions on when burst I/O is possible. For example they
check if the return address on the stack points to ROM or not.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> out though.

All three use a parallel connection between the C64 and the 1541. A while ago I took some measurements with a benchmark program published in 64'er magazine long long ago. I'll convert the numbers to kB/s for easier comparison as well. For the C64, the magic program size is 202 blocks, which corresponds to a program that starts at $801 and ends at $CFFF (50kB), so all tests are made with this size, and they include the directory lookup.

For comparison with a harddisk, I also include tests with a CMD HD, connected with a parallel cable as well. The other C64 harddisk, the IDE64 is connected directly to the C64 and said to be much faster.

x-factor time kB/s
CMD HD Parallel 57.7 2.2s 20.0
Professional DOS L2 32.5 3.9s 12.8
Prologic DOS Classic 28.2 4.5s 11.1
Dolphin DOS 2.0 26.5 4.8s 10.4

Professional DOS has some special software switches which can make it even faster. All numbers were taken after power up.

> I would also be interested in how the fastest Apple][floppy rigs
> performed.

Me too.

> As for the Ataris I am already enlightened a bit. ;-)

Did they have a parallel connection at all?

You've to set it to one. CIO then decrements the pointer, then bails
out. The last byte on reading must be placed in the accumulator as well,
and the first byte on writing will also appear on the accumulator.

> But this is a bit tricky. In theory a user program can call your driver
> directly bypassing CIO. And then the z-page IOCB would not be set.

A program not calling a handler thru CIO is considerably broken.
Unfortunately, Atari BASIC *is* considerably broken due to its usage
of the "PutOneByte" vector. Basic will not set the data pointer or
the length (in neither IOCB nor the zero page) but expects to write
out the byte in the accumulator. Thus, *don't* burst then.

What Dos 2.0S does here is to check the return address on the stack for
the Os location. In case the call does not come from the ROM area, burst
is disabled. Yuck. As a side-remark, Os++ which is part of the Atari++
emulator has another fix: It allows the handler to define a special
put-one-byte routine that is different from the usual write so the
check need not to be performed.

> Every DOS performs this "trick", it is called burst I/O. They normally
> have some restrictions on when burst I/O is possible. For example they
> check if the return address on the stack points to ROM or not.

Well, yes - no - maybe. This "no burst from ROM buffers" is actually a side
condition due to the way how Dos 2.0S performs its burst. It first
copies the last three bytes from the target buffer, then inserts there
the Dos 2.0S "linkage" data you find at the end of each sector on disk
pointing to the next sector, then writes the disk sector directly from the
user location to disk, and then copies the data back. This obviously
doesn't work in case the sectors to be written are in ROM, and thus
burst has to be disabled. Dos 2.5 "fixes" this by manually copying the
byte over to its own disk buffer. This is actually a much better idea -
for example, you cannot only burst from ROM, you can also write parts

of the display-list without confusing Antic by overwriting parts of it
while writing.

So long,
Thomas

Exactly.

Which is why the "technically best" Atari games avoid to directly
manipulate screen memory but instead use the custom chip registers
excessively.
I think Elektra Glide is a prime example for this (among countless
others).

So in a nutshell: One can't really compare Apples and Ataris (oranges)
;-)

What "ROM from buffers" have to do with the return address on the stack
???

>doesn't work in case the sectors to be written are in ROM, and thus
>burst has to be disabled.

As a matter of fact, DOS 2.0 doesn't disable burst I/O when writing from
ROM. And yes, it corrupts the file.

Likewise, I'm pretty sure the Hyper-XF mod can also only read PC/ST
disks. Perhaps if someone makes an XF-551 compatible drive, they can
add more ram that would allow new features.

There is an interesting caveat about the drive speed issue (288 vs.
300). Drives that run at 300 rpm with no compensation (Percom,
et.al.) do a pretty decent job in single density. But my experience
with several Percom's and the ATR8000 is that if you try to read a 288
rpm double density disk on a Percom/ATR or vice-versa, the R/W
reliability is really poor. Of course, reliable DD is always tougher,
especially on 5-1/4" floppy drives.

I don't either but from the gamers (and home computer users in general) point
of view, computers were divided between 8-bit and 16-bit categories much like
the game systems were. The Apple IIgs fit in the latter category. The Commodore
128 did not.

> Z80 to R-series - but of applications. The IIgs was the next generation

But the Commodore 128 wasn't so much a 'next generation' computer as it was
a modest upgrade to the C-64. By your logic, The Atari XE line would have
been the 'next generation' of Atari 8-bit computers from the XL line which
was itself the 'next generation' from the original 400/800 line. But really,
the Atari enhancements were mostly cosmetic and memory related. The 128 was
slightly more of an update only because it had a slightly faster CPU, enhanced
basic and a couple extra video modes. Unlike Commodore and Atari, Apple truly
did make a 'next generation' Apple II with the IIgs and I think Commodore
would have been much better off doing the same kind of thing. To the home
user, the IIgs was a direct competitor to the Amiga and Atari ST lines while
the Commodore 64 and 128 were more in competition with the Atari 8-bits and
Apple II/IIe etc. both in price and performance.

Here in the U.S. there was a period of about 2 or 3 years where the IIgs had
a lot of software (games anyway) available for it.

Yes, Apple intentionally killed the IIgs in favor of the Macintosh. If they
would have enhanced the IIgs it would have been too much of a competitor to
the Macintosh line.

Commodore was also notably horrible in their marketing and business decisions.
They were making money on the Amiga but they were losing tons trying to market
and sell PC compatibles. I don't know what happened to Atari. I think they
just had too much of a reputation as a games company (more so than Commodore)
to be succesful in the computer industry.

> And in classic Atari style, 3 years ago, I bought a brand new Jaguar.
> One of the computer game chain stores was saturated with new Lynx and
> Jaguar consoles and games around 2002. Systems which died far, far

I also bought a new Jaguar very late. About 3 or 4 years ago I picked one
up at a popular toy store chain for $24.99 U.S.

They put ST/Amiga/Mac together, though. All 68K, all 8MHz. The ST is so
close to a Mac that mine runs System 6.0.4 quite happily with only a
minimal amount of glue logic and some ROMs plugged into the side - most
of that glue is for the drive control, too.

They weren't intended to be, though. XEM? Nothing planned actually
happened, of course. Commodor C65 - apart from being too damn late -
never happened.

> The 128 was
> slightly more of an update only because it had a slightly faster CPU, enhanced

But they didn't. The C65 never surfaced in stores.

> To the home
> user, the IIgs was a direct competitor to the Amiga and Atari ST lines while
> the Commodore 64 and 128 were more in competition with the Atari 8-bits and
> Apple II/IIe etc. both in price and performance.

My point though, is that from a corporate point of view (and for many
home users), the Atari ST, Commodore Amiga and Apple Macintosh were
considered contemporary and in competition. Amusingly, it is the Amiga -
the most powerful of the bunch in raw hardware 'out of the box', that is
most often considered to be the Apple IIgs competitor in that lot.

Atari didn't want you to buy an ST instead of an Apple IIgs. They wanted
you to buy it instead of a Mac. Commodore didn't care, they just wanted
you to buy something, anything.

> Here in the U.S. there was a period of about 2 or 3 years where the IIgs had
> a lot of software (games anyway) available for it.

I remember the first time I visited the US, was 1990ish. I had a Mac
IIx, Apple //e and a Tandy 102; the sight of Apple][magazines in
stores, games for the Apple][, Apple IIc+ units on sale. It was like
something else; a shop made just for me!

Still, I remember when I had my Lisa and being taken to the AppleCentre
by my dad, asking about the IIgs on show and being told it was an Apple
II, and not as good as the Mac SE we were buying for the office - I
wanted it instead of the Atari ST I was getting but they wouldn't even
switch it on :/

Richard - I mean, the whole point is moot as out of the pair, the
Commodore is clearly caned by the Atari except where sound is concerned,
and since Pokey is still pretty good it's a fairly shallow victory. I
just think that the Apple][deserves more recognition than it gets.

Hi,

> Hi all, need help with an 800xl. I recently was given a slighty dead
> 800xl, and I am wondering what could be wrong with it. It is failing
> in the rom test, and this diagnostic program runs as soon as the 800xl
> is powered up. Also, it only shows 40 blocks in the ram test, not the
> normal 48. Both roms show red.

As for the ROMs: Might be that they are just screwed. I had a similar
symptom for the XL of a friend of mine: The ROM just went bad due to an
electric discharge at the parallel port.

If the RAM test passes, chances are that the CPU is fine. If you only
see 40 instead of 48 blocks, try holding the OPTION key on power-up,
this will disable the built-in basic.

So long,
Thomas

Nothing, two separate issues. No burst if a) called from anything but the Os-ROM
and b) data transfer from or to the ROM.

> As a matter of fact, DOS 2.0 doesn't disable burst I/O when writing from
> ROM. And yes, it corrupts the file.

Outch. My memory must be fading.

So long,
Thomas

>> performed.
>
> Me too.

Locksmith "fastcopy" was probably about as fast as it got for 5.25"
floppies. UCSD Pascal did pretty well too -- if you've ever seen it
load an 8K hi-res image you know how fast it can be.

In theory the data came in at exactly 4us/bit. Minimum length for a 4K
track is 6384 8-bit bytes if you use the recommended header padding.
That yields 0.204 seconds to read one track. IIRC, the Apple II is
capable of reading and decoding a track in one pass, though ProDOS
skewed the sectors for a two-pass read because otherwise write performance
was extremely poor.

I don't know how long it takes to seek to a new track. I know the head
can run across 35 tracks in about a second, so if we're conservative and
call it 0.1 seconds to move one track, we get 0.3 seconds to read a track
and move on to the next. That means something like 15KB/sec.

I tried to follow this up with an actual experiment, timing LS5.0 fastcopy
as it read a disk, but couldn't get it to work on my IIgs (perhaps it
doesn't like the smartport interface?). Disk Muncher 1.1 seemed to be
reading about 4 tracks per second, but it didn't read enough at one shot
for me to get an accurate reading.

Perhaps somebody else can do it. In any event, the maximum conceivable
transfer rate for an Apple II 5.25" floppy is 5 tracks/second, or 20KB/s.
(Unless you jack up the speed and write 18 sectors per track, like
Broderbund did for some of its games.)

Officially since ~Feb 1983. There were also two non Atari scuzzy
interfaces, one with a 1.4 meg floppy expansion card available.

Unofficially there was a Covus hard drive interface that worked with the
Atari 800's PIA chip even before that IIRC.

Which only proves?

At some point when you start including 3rd party hacks you are no longer
talking about the computer in question but some kind of hybrid. A Chevy
Vega with a Ferrari engine would be fast but it's not really a Chevy
Vega any more. Ultimately you are talking about what a .1 MIP 6502<which
is what all the computers in question perform at> will do which is the
same thing.

Nope, Atari also had terrible marketing and made worse decisions in what projects to develop or skip. They deliberately started ignoring the strong German market where the Atari ST line had developed into a tough Mac competitor in the late Eighties (some software projects still actively developed, like Papyrus Office, iCab or Calamus SL, have Atari ST origins). Instead, they half-heartedly marketed the Falcon030, a machine not satisfying the gamer (hardly any titles were ever published) and disappointing the professional - only musicians liked it due to it's integrated DSP.

After that they also made the Atari Jaguar a great flop. Despite having the first 64-bit video game system, far superior to anything available at it's time, they failed to support the few developers able to get something decent out of the great, but hard to program hardware (like Rebellion, who published the first Alien vs. Predator title exclusively on the Jaguar) by properly marketing hard- and software. And they continued this behaviour until Sony's Playstation literally conquered the market and swept the Atari Jaguar and the existing 32- and 16-bit systems away.

This was the end of Atari Corp., the remains were sold to Sega, Hasbro, Infogrames etc..

Thorsten

Don't you also need at least one entry in the display list? My Atari
docs are not near me at the moment so I can't recall and I'm not sure
whether extrapolating "backwards" from the Amiga is accurate in this
case.

It is, Tom, on the 'from ROM' situation; I once tried to binary
save a Joust
cart with DOS 2.0 and the first 3 bytes of sectors were the same
as the
last 3 of the previous ones plus the file was too long. I went
thru with Disk
Tool and modified every sector link, but never managed to load
and
execute it.

Message-ID: <4208E722.F7F50786@students.uni-mainz.de>
Source record: 12744

So,
how exact are those Baud rates given by several floppy drives then ?!?
Just some examples (for more read the A8FAQ!):

- Atari 810 / 1050: 19,200 Baud (1x 19.2 or single speed)
- Atari XF551: 38,400 Baud (2x 19.2 or double speed)
- some ultraspeed drives: 57,600 Baud (3x 19.2 or triple speed)
- some other US drives: 76,800 Baud (4x 19.2 or quad speed)
- Super Speedy (with 192k or 256k RAM onboard): approx. 96,000 Baud

Looks like most of the given Baud rates are only a theoretical value
(and in most cases the maximum value)... in practical use they are not
reached...?!?
-Andreas.

Yep,
normally the XF551 drive hangs up when changing disk densities (from time to time you have to power it off and on again). But with the Hyper-XF OS by Stefan Dorndorf you merely need a second (read/write) try and everything will be fine (no more lock-ups when changing from SD to DD or from DSDD to SSSD). Besides, it is possible to add a kind of switch and connect it to the FDC of the XF drive. It will then automatically detect the density, whenever a disk is changed (just like the 1050 drive)... -Andreas.

Well,
visit atariarea.histeria.pl then register and finally download the programs from their "pliki" site. Too complicated ?!? Ok, then simply e-mail me and I will send you all the MOD / NEO / MD8 players and converters I have. Let me know if you also need some demo-sounds (at the moment I have 50 disks with MOD-sounds, 50 disks with NEO sounds and 40 disks with MD8 sounds).

Maybe you do not know, MOD is 16bit (or sometimes 8 bit) sound. NEO is merely converted MOD sound (8bit only) and MD8 is again converted MOD sound (4Bit if I remember correctly)...

Mod players: - Inertia 2.x, 3.x and 4.x all by Madteam (128k or more)
- Protracker 1.5 by MadTeam (128k or more)
- Modplayer by the Gatekeeper (48 or 64k or more)

MD8 players: - Soundtracker 1.x, 2.x and 3.x by various authors (64k or more)
- Fampy 2.3 and Fampy 6.1 by W. Freitag / Friday (64k or more)

NEO-Player: - Neo-tracker 1.5 by EPI/allegresse (128k or more)
(will load MOD files and save them as NEO files!)

there is also a MOD to MD8 converter by Mirage and ANG available in english and polish language. Afaik all these programs can be downloaded at atari-area...
-Andreas.

P.S.: I do not have a 48k machine, so I cannot tell if a program requires a minimum of 48k or 64k RAM...

Well,
ask me - I do have these utils in my collection. Two utilities were
written by polish programmers (Read360k.COM and Write360k.COM), while
another utility was written bo Robert "Bob" Puff (READIBM.COM). But I
never tested them, since I do not use 360k floppies on my PC any longer
(allthough it still has a 5,25" HD floppydrive, from time to time used
for Ataridsk by HiasSoft which reads/writes 180k Atari disks)... So,
simply e-mail me to get these programs as zipped ATR images in return.
-Andreas.

847. Re: XF551 read/write IBM 360K disk ???

Message-ID: <4208F859.74E90FEE@students.uni-mainz.de>
Source record: 12602

Well,
so why where these utilities made, when this would not be possible ?!? A Happy 1050 can read a 180k IBM disk and a XF551 can read a 360k IBM disk as well !!
Memory does not matter here, both drives simply read the IBM disk-sectors in halfs - meaning first bytes 1-256 and then bytes 257-512 of an IBM disk sector. so the reading and conversion process takes quite some time - but it is possible !! -Andreas.

848. Re: XF551 read/write IBM 360K disk ???

Source record: 12603

Yes,
the Hyper-XF can read PC/ST disks (it includes the commands to do so),
but alas it lacks the software. It can only read ST/PC disks, but not
write to them. If the Hyper-XF OS version A is used with a 5,25" drive
it can read 360k PC/ST disks, if version B is used with a 3,5" drive it
can also read 720k. But as said before, the commands are available in
the OS (and explained very detailed in the german manual), but one has
to write some software to do so... -Andreas.

Andreas Magenheimer <magea000@students.uni-mainz.de> writes:

>how exact are those Baud rates given by several floppy drives then ?!?
>Just some examples (for more read the A8FAQ!):

>- Atari 810 / 1050: 19,200 Baud (1x 19.2 or single speed)
>- Atari XF551: 38,400 Baud (2x 19.2 or double speed)
>- some ultraspeed drives: 57,600 Baud (3x 19.2 or triple speed)
>- some other US drives: 76,800 Baud (4x 19.2 or quad speed)
>- Super Speedy (with 192k or 256k RAM onboard): approx. 96,000 Baud

These numbers are just the serial transmission speed in BPS (bit per second). They just specify the period for a single bit. More precisely, the time it takes from the starting of a bit transmission until ending the transmission for this same bit. Note that with the above definition, there might be a delay from the end of one bit until starting the next one. But there is a lot more than must be done besides transmitting just bits.

In first place those numbers are approximate, and not even close in some cases. The common Warp/HI-Xfer speed used in the U.S.D/Happy, etc is not actually 3x. It is approx. 52,600 Bps, quite slower than 57,600.

In second place SIO uses async serial communication. This means that one start bit and (at least) one stop bit must be added for each byte. So you have a 25% overhead for starters just on this. The hardware on the computer side supports synchronous mode, but this would require special hardware on the peripheral and even a special SIO cable. AFAIK this was never used (any one knows for sure?).

The SIO protocol has its overhead as well. For reading a sector from the drive, the computer must send a command, wait for acknowledgement, perform some delays, add checksum byte, etc.

As Matthias noted here, the 1050 doesn't have serial hardware, it is performed by pure software. This might introduce some significant delays between each byte. Some firmware implementations are more optimized than others, so the overhead is not fixed.

But what is more important, is that the sectors must be actually read (or written to) from the disk. And this of course takes some time. With track-buffered enhanced drives this takes usually a couple of revolutions per track. With stock drives this takes much more. Plus the head must be moved to the right track unless it's already there. Plus some settle delays.

There are some other delays/overhead as well that are less significant.

850. Re: Atari 800 XL (F) to buy / trade

Nope,
they were simply named Atari 800XL, like every other 800XL. The user had to find out the difference by opening the computer and looking at the motherboard (and probably counting the big chips)... Thus the name 800XLF was chosen by the users not by Atari itself... Believe it or not there were even a few Atari 800XL or 800XLF available with 128k of RAM and they were still named 800XL. In France where SCART is much more popular than Super-video (or S-VHS like we germans use to say), Atari even produced 800XL computers with scart connectors instead of the usual monitor ports. They were also named 800XL, but maybe some users call them 800XL (S) where "S" means SCART connector (not sure if that one has a Freddy or not, also not sure if it was available with 128k RAM or not).

Anyways, the 800XL(F) computers are a little bit harder to find here in Europe than normal 800XL computers (let`s say 800XLF are uncommon), but the 128k version of the 800XL and the 800XL with Scart are extremely rare... Me, I would like to get an original 800XL with Freddy, Scart and 128k RAM, grin. Also on my wish list is a 1400XL (not a 1450XLD) and a 65XEM. -Andreas.

A stock XF551 can't, as said, becasue of the different sector size. You
need a custom firmware at very least.

>Memory does not matter here, both drives simply read the IBM
>disk-sectors in halfs - meaning first bytes 1-256 and then bytes 257-512

Source record: 12607

Well,
1) move one figure to the middle of the board (power point);
2) move the same figure to one of the magic figures - kill the Sorceress or the Wizard (no more revive, no more Summon Elemental, simply no more magic!); of course other darkside figures will immediately attack you... hopefully you are a good defender, then...
3), 4) and 5) move three figures to the remaining power points (with or without killing opponent figures). Done !! tatatata - the white/dark side wins...

The game also has a nice gambit cheat: If you have the white figures, let one of your knights die. Then move your wizard to row 2 or 3 or 4 or ... 9 (not to row one, nothing will happen here). Next choose the revive function. don`t choose the knight to revive, instead move the cursor to the bottom and press the fire button. You will see some garbage appear here. move that garbage right beside your Wizard (like you would with any other revived figure). Depending at which row your wizard stands, you get a new figure - even one that you have not lost yet (e.g. a unicorn)...

Of course your surprised dark opponent will immediately try to do the same. Let him or her do so - it is your advantage !! As soon as he/she places the garbage besides his/her Sorceress a white figure will appear. In other words: you get another white figure, since this cheat produces *only* white figures... Finally, make a list, which figures are produced when the wizard or the sorceress stands in a certain row (row 1 = none/nothing, row 2= ..., row 3 = ... and so on). This is a nice cheat to surprise other Archon players or to win a little easier against the computer, if you have never won before... try it out !!
-andreas.

As an additional note. You still need more memory for writing 512 bytes
sector. You can read half a sector, but you must write them in whole.

Message-ID: <42091117.24A88E3A@students.uni-mainz.de>
Source record: 12614

Well,
when talking of speeders in general we can say (I think) that there were only two types of speeders for the Atari available: 1) with a track/cache buffer (Happy, Speedy and many compatibles) and 2) using some kind of sector skewing but no buffer (a kind of optimized sector layout; like US-Doubler, Turbo, XF551, Hyper-XF, Syncromesh and many similar speeders)... So the first question is, would it have made sense to use both a buffer and sector skewing and would this have increased the data transfer even further ?!?

Besides, how about parallel-bus floppy drives ?!? How fast are they or how fast could they have been if Atari had used them as the new standard (introduced with the 1450 XLD) ?!? And finally how fast can harddrives on the A8 be - via the parallel bus - or what is the highest possible (theoretical) data transfer rate of the parallel bus ?!? -andreas.

860. Re: Atari 8 bit versus Commodore

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-08 19:30:11 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <42091343.94286ACE@students.uni-mainz.de>
Source record: 12615

Well,
afaik all highspeed/ultraspeed drives that used track buffers were
already faster than normal (since they also included a new floppy OS).
If you wanted to load copy protected games with them, you had to slow
them down (make them unhappy, switch to slow mode, install the original
OS via software, etc.).

Not so with the drives/speeders that used sector skewing. They were as
slow as a normal drive and only jumped to highspeed/ultraspeed mode when
a) a certain driver/OS/DOS was available and b) a disk with sector
skewing was used. Since no commercial disk ever used sector skewing,
these drives always stayed slow.

So, when having lots of copy protected disks, I guess a drive with
sector skewing would be better, because you do not have to slow it down
to load these programs (instead you have to turn it fast via drivers and
sector skewing). But if you do not have much copy protected software a
speeder with track buffer could be better, since it is already faster
than normal drives (and can be made even faster with drivers, but sector
skewing is not required). Therefore these buffered drives have to be
slowed down when loading copy protected stuff...

Well, after all it is another matter of preferences... -Andreas.

Hmm, I suppose it buffered the whole source disk and then wrote target
disks without actually transmitting any data to the computer.

But even then, note that for achieving this speed it must format *without*
verify, usually not a very good idea. Well, in theory you can use double
or triple speed drive mechanisms. They rotate at 600/900 RPM, but they
are/were very expensive even second hand.

864. Atari 800XL and Macintosh

I have several Atari 800XL's and I currently use several Macintosh computers. I have a PC but I prefer not to use it whenever possible.

Anyway, I've read alot about the various ways of connecting an Atari 8-bit to a PC in order to use the PC's hard drive, printer, internet connection, etc. I am curious to know whether or not such a contraption is available for the Macintosh?

I would love to be able to dust off my Atari 8-bits and connect them to my Mac. Anybody doing this?

Thanks in advance for any possible assistance.

Hi all, thanks for the info!
I did try holding down the option button, and yes, I do get all 48
blocks!

As for the power, I tried two different atari packs, and same thing.
I haven't tried an AT power supply yet, I just think the chips are
screwed.

I will have to keep an eye out for a cheap 600xl and rip the chip from
it! :-)

Sometimes you have to kill one to save one! HEHE!

Of the two ROM chips, does anyone know which one does what?????

Thanks!

Michael

> than 10.

Right. I'd guess the average CPI is about 3 for the 6502 in most
situations.

And the issue is usually not what the theoretical maximum speed
of data transfer is, but what it is when doing ordinary disk
operations like program loads and saves, random file access, etc.

In these cases, the OS usually has a lot more to do with the realized
data transfer rate than the raw hardware!

I would agree with Andy that the Apple, using ProDOS, accesses 5.25"
floppy disks with an effective transfer rate in the 10-12KB/sec range
when doing typical operations on large files.

If loading a 10KB binary file, almost 3 seconds elapse before the
prompt returns, since the drive must be spun up, a directory lookup
done, a track/sector list read, and then the data read.

(I'm too used to a hard disk. ;-)

Which ROM chips do you need? I have come across several non-working Atari 8-bit computers over the years that I have scrounged for parts. I may have the ROM's that you need. Just give me the part numbers and I'll check to see if I have what you're looking for. Chances are that I do.

Hi all, thanks for the info!
I did try holding down the option button, and yes, I do get all 48 blocks!

As for the power, I tried two different atari packs, and same thing. I haven't tried an AT power supply yet, I just think the chips are screwed.

I will have to keep an eye out for a cheap 600xl and rip the chip from it! :-)

Sometimes you have to kill one to save one! HEHE!

Of the two ROM chips, does anyone know which one does what?????

Thanks!

Michael

Uhm. Jack. Those games are probably needing a game DOS.
I didn't know there was a double dens. DOS 2D. If you get a lock
or nothing happening with boot, then you have no game loader or DOS.
Seems like the same answer. If you are expecting a game to boot when you
copy a file to a disk, you aren't correct. There are only two things that
will boot, a boot disk game, or a DOS, game or regular DOS. I would guess
the Wolfenstein games require a game DOS. If they are ATRs or something
then you can't copy them to a disk and expect them to work.

Actually, my experience has differed. My original XF551 would boot a DD disk on the second try, and since I upgraded to the Hyper-XF chip it boots on the FIRST try each and every time. I've never experienced the lock up you're referring to.

> commands/functions in English, however what I'm looking for the a
> technical, behind the scenes look... So far nobody has anything like
> that :)

So what you expect to find, in the technical sector? Turbo-Basic is
more or less a hacked-up Atari basic, with some important changes, though:

1) On for/next loops and Gosubs, Turbo-basic keeps the address of
the last token on the stack, and not the line number. Loops and
subroutines are faster for that reason.

2) It comes with its own floating-point package that gains speed basically
by unrolling the loops of the fp-ROM ("MathPack"). The methods of computation
are actually identical.

3) Additional instructions. This is rather "straight-forward" (-;

So long,
Thomas

I don't know where to obtain it. A reader of this newsgroup contacted me
off board and was kind enough to offer me a chip.

I've only seen two pieces of information written on it - even a Google comes
up pretty short. One place is the FAQ for this newsgroup and the other is
mixed in with some instructions for the QMEG OS that were translated from
German and is a bit messed up. I don't see a problem with posting that, so
it follows:

*****
*****

The hyper+ XF ROM - a new development f?r the XF551

In time to the ABBUC JHV I finished a new operating system f?r the XF551,
mentioned hyper+ XF. There are two variants, one f?r to 5,25"-Floppys and
one, which are intended f?r converted XFs with a 3,5"-Laufwerk. The
installation of the hyper+ XF ROM is very easy, one mu? only the XF?ffnen,
which lever old ROM chip from its base and which new use. Also the change
in a 3,5"-Laufwerk is m?glich without L?ten. It l??t itself however only
single -, medium or double Density uses (max. 720KB), High Density (1,4MB)
is not m?glich, since the floppy CONTROLLER does not control WD1772 into
the XF this format.

Here the extensions built in the hyper+ XF ROM in the comparison with the
XF551-ROM:

1. Ultra speed and hyperspeed

All OS and many DOS version f?r the XL/XE unterst?tzen the Ultra speed of
the Speedy and Happy (e.g. SPOS, QMEG-OS, US+OS, Bibo DOS, Sparta DOS).
Now also the XF551 understands Ultra speed, what continues to accelerate
diskette operation, here a comparison:

XF551 normally: 100%
XF551 High speed: 160%
XF551 Ultra speed: 200%

Should have you still no Ultra speed f?higes OS in your computer,
hyperspeed is used: Hyperspeed is just as quick, has gegen?ber Ultra speed
however the advantage, there? daf?r the n?tige routine is very small (only
128 byte) and into the ATARI XL/XE operating system latch themselves l??t.
This routine is already contained of the 1050-TURBO-Erweiterung in the

hyper+ XF ROM and can be already loaded?hnlich as with before that boats of a disk into the ATARI (through boats without disk in the drive assembly). Au?erdem l??t itself software f?r the XF551 easily in such a way patchen, there? Hyperspeed is unterst?tzt.

In order to use the high speed also with a DOS, as with the normal XF551 the disks m?ssen being particularly formatted (Ultra speed second gate Skew). That happens?brigens automatically, if the formatting command is sent by the DOS in Ultra ultra-oder hyperspeed to the XF. For copying disks I will develop still another special disk copier (hypercopy), which reads and writes the sectors also with normally formatted disks quickly.

2. Formats, partitions and operatings mode

Disks k?nnen in single, medium or double to be formatted alternatively on one side (with 3,5"-Laufwerken only 40 TRACKS) or bilaterally (whole disk). E.G. 2880 sectors with 256 byte stand to the Verf?gung, make together 720KB. one need a suitable DOS (MYDOS, SpartaDOS, BeweDOS) to only use with the bilateral double Density format on 3,5"-Disketten.

With the hyper+ XF can one in addition, a 3,5"-Diskette in four partitions divide, with 5,25"-Disketten stand for only two partitions to the Verf?gung. On each partition contents of a 5,25"-Diskseite (single/medium or double) l??t themselves accommodate and nat?rlich also with each DOS work on. Au?erdem can be gebootet each partition.

F?r the administration of the partitions gives itself it the following eight operatings mode, more?ber the Bootmen built in the hyper+ XF ROM? to adjust leave:

Mode A,B,C,D:
Access to one of the four partitions of a 3,5"-Disk. With these four modes one knows the appropriate partition boats.

Mode M,F: (multi, multi-format)
The four partitions can be accessed with ascending drive numbers (abh?ngig of that
Switch attitude in the back on the drive assembly). If the XF is adjusted e.g. as drive assembly #1, then become with D1: to D4: the partitions A to D addressed. One has quasi four drive assemblies to the Verf?gung, which is zusammengefa?t on a disk. Thus one can access with each DOS the entire disk or copy together also e.g. the four data disk side of " Alternate Reality - The Dungeon " on a 3,5"-Disk, which makes diskette change?berfl?ssig when playing.

In the f-mode zus?tzlich with each partition change an inquiry of the Density is durchgef?hrt, so there? one also without special software between differently formatted partitions to change can.

Mode S: (ST/IBM/HDI/Standard mode)
Serves for the access to double-sided disks in the old standard format, as it is used e.g. by the HDI. Also ST/IBM-720KB-Disks do not k?nnen in this mode to be read, letters go however.

Mode X: (XF mode)
This mode is active when switching on of the XF on, it corresponds to the normal XF551-Betrieb. The mode X differs from the mode S only by the format on the R?ckseite the disk (the XF551 stores the sectors on the R?ckseite " wrongly around ", e.g. the logical sector 1441 in the s-format on TRACKS 0, sector 1, in the x-format against it on TRACK 79, is sector 18 with a 3,5"-Double-Density-Disk).

3. Bootmen?

Bootet one the hyper+ XF without a disk, becomes a Men? indicated, with which one knows the operating mode?ndern or which can load hyperspeed routine into the computer. When leaving the Men?s an inserted disk is then gebootet.

4. TRACK analysis and formatting instruction

Hereby many kopiergesch?tzte disks (single or medium) can be copied, a fast sector map function use (?hnlich Speedy Diskmapper, in 10 seconds to become 40 TRACKS scanned) and own arbitrary formats to produce.

The TRACK analysis is at least as well as the MS copy f?r the Speedy, to be copied k?nnen disks also
- ver?ndertem sector Skew
- ver?nderten sector Abst?nden
- DATA CRC error
- header CRC error
- record type error
- record emergency found errors (zerst?rte sectors)
- doubled sectors (phantom sector)
- are enough for sectors (draw DATA error)
- short sectors (up to 44 on a TRACK)

5. Improved Density inquiry

The hyper+ XF can change without special software (like DOS with XF Unterst}tzung) of single or medium on doubles. However as with the XF551 only after the first access to a disk the density is correctly adjusted. If one calls the directory thus e.g. with a DOS without XF Unterst?tzung after a disk change, then folds only with the second time (only if one from single/medium on doubles or changes in reverse). With DOS version, which reads with a?ffnen file the sector 1 (Sparta DOS, MYDOS), gives it against it no problems.

The hyper+ XF offers however the M?glichkeit to insert with something L?ten a contact at the drive assembly flap then the Density inquiry functions?hnlich as fully automatic with the 1050. That can be done however only with 5,25"-Laufwerken, with 3,5 " because of the lack of space in the drive assembly will probably fail.

The disk utility (sector copier, TRACK copier for copying gesch?tzter disks, disk map by, partition Auswahlmen?, ST/IBM disk readers) are not finished yet. I become it therefore gradually on the ABBUC disks ver?ffentlichen.

Price of the hyper+ XF ROM (zun?chst without disk utility):
Collection: 25 DM
Order with v-cheque: 30 DM
Order by cash on delivery: 30 DM + NN Geb?hren (at present 6.50 DM)

You can't, the align hole is the guilty part, i think it was another design
flaw courtesy of Atari... Why???
you'll never know for sure...

I did read that you can actually punch a second timing hole in the disk to use it as a "flippy" in the XF551 - also, disks which come with two timing holes (and some apparently do) will work as flippies...

You can punch a second timing hole in a floppy disk?

I know that you can punch a second write protect hole in a floppy so
that the drive doesn't see the reverse side of the disk as being write
protected. But the timing hole? I'm not sure that I would want to be
punching holes through the actual floppy medium. Punching such a hole
can't be too good for the integrity of the medium.

Yup... I ran across a web page which had step by step instructions... It suggested you use an old floppy disk as a template... Cut down the edge and remove the magnetic media inside then place it upside down on the media you want to turn into an XF551 compatible flippy. Mark the timing hole, which now marks the other side of the flippy we're creating. Do the same with the other side of the disk. Then place a strip of paper inside the sleeve from the hub to protect the actual meda as you insert the paper punch first on one side of the plastic sleeve then on the other...

Sounds like kind of a pain, and though I haven't actually tried it (yet), it sounds like it should work...

Sounds like a surefire reason to ensure that you have backups of
anything you place on those modified floppies.

Are 5.25" floppies difficult to buy new? It's been a long time since
I've purchased 5.25" floppies. Are they still readily available?

The XF uses the timing hole for formatting, but for most U.S. XF's,
they will still write to an already-formatted disk. If you just have
few disks, making a "flippy" is the way to go.

Several XF mods have been created to allow "back-side writing" to be
done electronically, but except for the CSS "Enhancer" (no longer
available), they are difficult to install (IMO). These either use
LED's/photo-receptors or a small magnet/reed-switch. I'm not aware of
any others. What you need is a timing "pulse" that mimics the timing
hole.

FWIW -- have you considered converting the XF-551 to a 3-1/2" mech?
There are no "back-side" issues, and you get double the storage with
more reliable media.

OTOH -- adding a U.S. Doubler to a 1050 is pretty easy and quite
inexpensive, although depending on your board jumper settings, it can
require soldering a couple of jumper wires.

I know very little about SD, but I have a Sparta-format disk that I
want to copy the files from to an Atari-format disk. I successfully
used XCOPY to transfer them, but the files are corrupt after transfer
(and all show up erronously as 66 sectors long on the Atari disk.)
Repeated with the same results. Does XCOPY have "issues", or perhaps
there is something I'm not doing correctly? Or maybe there is a
better alternative?
Thanks,
Larry

thanks GFA! I will certainly do that. My goal is to, as a project,
improve upon the Turbo Basic and add full string handling and sprite
and scroll commands. Best way to get back into 6502 programming, and on
a new machine to boot! I'm an ex-C64 guy, having been dabling with the
Atari for a short while now, and it's a lot of fun having to play with
display lists, etc.

Anyway, thanks for all the help, hopefully in few months I'll be able
to report back with some success!

Polbit

You don't punch the medium, just the jacket. Still probably dangerous.

I seem to recall there was a special puncher specifically for making a
second index hole on the jacket. I never actually saw or used one of
those. But I think I saw them advertised in magazines. And if I remember
correctly, there was a picture and it was shaped more or less like a
nutcracker.

Anybody remember this, or actually seen one? Not sure for what system this
was targeted, certainly not for Atari (was much older than the XF-551).
Might be PC single sided drives?

Note: Not talking about the small puncher for write enabling the second
side.

I don't know XCOPY. But to copy files from a DOS 2/2.5/MYDOS type disk to a Sparta disk, boot Sparta (3.2d, 3.2g) and type the command:
COPY D2:*.* D1: (DOS 2 disk in D2, Sparta disk in D1:)

OK, the XF551 uses the timing hole and can only access a disk
that is in 'upside'. With other drives, you can cut a notch on the
left side of the disk and turn it over to format and use the back side.
ie. if you want to use both sides in a XF drive, you have to format
using both sides. SpartaDOS probably has this ability, and maybe MyDOS.
Getting into punching a second timing hole is problematic, I would think.

> product as soon as its completed.

I've missed most of this thread as I've only recently re-subscribed to it
after some years of lurking-absence.

I built one of these devices and used to Print to it via my RS232 port to
get it to speak. I've only recently given it away after years of non-use.

I built my own PCB after knocking up my own schematics with reference to the
Tandy supplied manufacturers data sheet that came with the speech-pro.

Actually whilst rabbiting away i recall that Maplins made a PCB to fit into
a Sinclair computer expansion port and supplied a kit of parts to complete
the project.

Hi Russ-

Thanks for the info. I'm going the other way (SD -->MyDos), but
reading further in the SD manual, SD 3.X should recognize the
Atari-Dos type disk format. I did try the COPY command and my system
locked up. I'll try a couple of variations with COPY, and if those
don't work I'll try SDX.

Hey, Larry.
You might want to try to COPY just one file at a time. I suspect, if you're getting a lock up, that there's a problem with one or more of the files, ie. some sectors are bad within a file. Sometimes, disk drive may be the problem, it may not be functioning correctly at high sector numbers for instance.
When you get a lock-up, can you recover with a RESET, or is a 'hard' lock-up that requires power off/on?

I dunno what keeps the speed of most Atari drives.
I do know Atari drives are smart, and probably the speed is regulated within
the drive.

>Atari 1050 and the most 3rd party drive use something instead of the timing
>hole. Something measures the speed. Do you know what it is called?
>Magntic.......

No. The 1050 doesn't use anything at all to measure the disk rotation speed. Furthermore the 1050 is not even aware if there is a disk actually inserted or not. Only indirectly by reading a sector you can, if you want, measure the speed. But of course you can't do that on a virgin unformatted disk.

The 1050 simulates the index hole pulse internally. One output of the RIOT goes to the IP input on the FDC. RIOT stands for Ram/Input/Output/Timer, it's a chip in the 1050 similar to the PIA but with the addition of Ram and timer. Precisely the output of the timer is used to simulate the index hole pulse after a period equivalent to one disk rotation.

>> OK, the XF551 uses the timing hole and can only access a disk
>> that is in 'upside'.

Most XF551 drives can access the flippy side for both reading and for writing, it can't format that side without some kind of hardware mod though. Some cannot access the flippy side at all, it depends on the drive mechanism. Some drive mechanisms will not become ready if the don't detect the index. Formatting is a different issue, it is the FDC that will not start the format operation without receiving an index pulse.

Yeah you can format a 360K DSDD disk with the XF, but
a SSDD drive (Indus, douled 1050) won't be able to read
the back.

Hello all,

Just aquired an 800 to go with my two 800XLs.

The 800 came with OmniMon (w/ 3 position switch on back of case) and has two Rampower boards by Axlon, 128k and 32k each. Also has a 16k RAM board.

I have not had any luck getting a ramdisk set up. Tried instructions from OmniMonXL users guide, but have not gotten a ramdisk on DOS 2.0s or 2.5. The board I have is an OmniMon, not an OmniMonXL. Are the instructions different between the plain and XL versions?

Also, the 3-position switch allows me to get to OmniMon with the key sequence of either 'Select'-'Reset' or 'Select'-'Option'-'Reset' when the switch is in the 'down' position. The other 2 positions for the switch seem to disable OmniMon. What do the other two switch positions designate?

This 800 does not have OmniView. I went ahead and read the OmniView docs regardless, but still didn't find what I needed.

Anyone have the docs for the plain OmniMon? (not OmniMonXL)
How about docs for the Rampower upgrade(s)?

Could something similar (but relatively simple) be created for the XF?
The CSS "Enhancer" mod was connected with a few solder points and a
hole for a switch to change the type operation from XF to "1050".

Howdy James

I can not imagine why nobody has given this a try, so I will:

> According to the BB manual, the pin outs are:
>
> Transmit Data, Pin 3
> Receive Data, Pin 5
> Req to Send, Pin 7
> Clear to Send, Pin 9
> Data Set Ready, Pin 11
> Signal Ground, Pin 13
> Carrier Detect Modem, Pin 15
> Data Term Ready, Pin 14
>
> Now, if I read my MSS manual correctly, the pins for the MSS1-T are:
>
> TX Out, Pin 2
> RX In, Pin 3
> RTS Out, Pin 4
> CTS, Pin 5
> DSR In, Pin 6
> Ground, Pin 7
> CD In, Pin 8
> DTR Out, Pin 20

From what I can see, just connect the first one of the first list to the
first one on the second list, then repeat this till you get to the end.

BTW what is an MSS1-T?

I don't know for sure. Probably yes, but I don't think it would be worth.
You need special firmware and this will only solve the FDC formatting
issue. It sill won't work if the drive mechanism itself requires the index
hole. So a mod that works at the drive sensor level seems a better choice.

Yes, Apple Mac OS X is like Linux (a full unix with
Samba/Apache/MySQL/LDAP/CUPS...) with the best GUI you can get for an Unix
System today.

And yes, Mac OS X can read FAT/VFAT Mass Storage Devices, no problem....

Atari800Mac is the best Atari800 Emulator I know.

And it seems that SIO2PC is not also coming to the Mac.

But Linux is also nice if you like to do more "diving deep into the
system".

But you can also dual-boot Linux/PPC on a Mac. Or OpenBSD/NetBSD ....

Carsten

I'd vote for Linux. As was mentioned in another response to this thread,
the Mac OS running on the 'Nix core is slick and pretty, but you can delve
further and deeper with a "pure" Linux distro.

Also, unless prices have really changed in the Mac world, you can get an
awful lot of PC hardware for what you'd pay for a Mac.

Honestly, I don't think you can "lose" with either choice. :-)

This sounds almost to good to be true. :-)

If the MAC can read FAT/VFAT Mass Storage Devices, I can use it to set up my
SIO2IDE interface. Today I received the version 4.x PCB, I already have the
harddrive and the 2.5" to 3.5" convertor. The Atmel ATmega32-61PI has been
ordered and should be on it's way to me as we speak. And yes, I plan to

write an article on it for the ABBUC magazin. I've seen a very nice case for it, I hope I can still buy that one.

Thanks for the quick response.

Now that you mention it, I have read the same thing - that the XF551 will write to the back side of "flippies," just not format them. I guess it would be easier to just use the 1050 to format the disk on each side and go from there.

935. Atari 8-bit to S-video cable question

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-13 12:02:56 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1108296393.23524.0@spandrell.news.uk.clara.net>
Source record: 12590

Hello All,

I've just put together an Atari 8-bit monitor socket to s-video (4-pin mini-DIN) cable for my own use. Tried it on my 800XL, 130XE, and 800 (PAL machines). It didn't work fully on any of them. The 800XL was in colour, but the colours bled badly. White came out with green and blue shadowing, with a thick green stripe down the left hand side of the screen, and a blue one at the right hand side when on the standard Atari blue background with READY at the top. The 130XE was better (no stripes) but still had a degree of colour bleed around the white text. The 800 was the worst of the lot. It looked like black&white at first, but it was in colour, but faded. Tried on 2 different TVs with the same effect.

Anybody had this problem? It appears that not all machines have the chroma/luma connected, but I've not read of any problems of this nature.

Dean Garraghty

Message-ID: <12e3f8fa.0502130604.6e7468af@posting.google.com>
Source record: 12592

I have two dead, stock 551's. One had broken SIO traces, but I have successfully repaired them. The other's traces are fine (riveted jacks). But still neither will work -- they power up and "seek", but will not boot.

On U.S. models there are only 6 chips:
The 8040/8050 mcu; the WD1772 FDC; the system ROM; a 74LS14P; a HD74LS38P; and a SN74LS373N. The numbers stenciled on the board for the 3 smaller chips are just the "generic" versions of the IC's. Can anyone explain how these chips differ from standard versions -- specifically the "HD" and the "SN"? Finding these specific versions of the chips looks like it could be tough/expensive. Has anyone in our group successfully fixed a 551 with something more seriously amiss than broken SIO traces?
Thanks,
Larry

938. [Probably OT] "Activision" games in Burger King kids meals

Sorry if this isn't exactly the right place, but the 2600 VCS newsgroups were more spam ridden and this group is cleaner in spam. Plus you can spread the word if ya want, move or delete this post. ^_^

Anywho, I didn't know this until yesterday, but BK has for their kids meal premiums these little "Activision" LCD games - Barnstorming, Tennis, Kaboom!, and Grand Prix - based on the Atari 2600 games (sorta). In Kaboom! (the one I got), you catch hamburgers, and in levels 3 and 4 (the last 2 levels) you have 2 mad bombers tossing them down. Not too easy like McDonald's LCD thingies last year Anywho, each game comes in 2 colors. Annoyingly, the Burnit King we had stop at (one friend in the car felt sick) didn't have all 4 in stock at the same time. Any Activision nuts out there should be on the look out also for the 3 and under kids toys, too. At least it looked like they had "Activision" young kids toys...

Enjoy and share.

"Read this very carefully, I shall type this only once nyo!"
"There would be little point in typing it twice nyo!!" - 'Allo 'Allo nyo

I've been planning to do the same thing for a few days now (for an 800,
NTSC). I just haven't gotten around to it yet.

>From light reading on this subject I've learned that some or all 800XLs
had chrominance disconnected substituting composite video instead at
pin 5 (or disconnected, not sure which) on the DIN connector.

I assume you only built a simple cable, Atari DIN to S-Video, and
didn't look into Ben Poehland's Super Video mods 2.0 and 2.1 for the
800XL or Charles Cole's mod for the 130XE (see links).

I think the mods are necessary to obtain satisfactory S-Video output
(no bleeding) with the 800XL and 130XE.

Your result of seeing only Black & White output from the 800 seems to
indicate you just have a basic wiring problem. I got that same result
when I accidentally reversed two connections of an S-Video connector

(for a different project). I don't recall which pins I
cross-connected, though.

I haven't been able to find equivalents of the Super Video mods for the
800 so I'm just going to try making a basic S-Video cable for my 800
and hope for the best. I'm starting it right now.

I'll let you know my results.

Links to the aforementioned articles can be found at Clarence Dyson's
Atarimods page.

Hi Dean.

http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

Sounds like your TV is trying to lock onto a chroma signal that isn't there.

It may be that the chroma signal is not on the right pin, but bit of it leaks into the luma signal so that it doesn't turn off it's colour circuits.

The cable is easy enough to make.

You will have to check the cable and that the chroma is wired to the socket. Atari only wired it on their late machines, so that is highly likely to be a cause.

My cable is done. Just as with my other project I got pins 3 and 4 mixed and was greeted with a ugly, rolling, B & W image. When I got the connection right the picture was beautiful.

This S-Video connection is far superior to the RF and composite video connections I was using earlier. There is far less noise, almost none.

My situation may be unique. I'm using an original ATI All-in-Wonder video card, part of one of my PCs, not a standalone television or monitor. The RF and composite video connections using the AIW were producing unacceptable herring bone patterns with one and random noise with the other. This is why I wanted to try the S-Video modification.

Dean, none of what I said answers your question. I don't know the answer. Sorry.

Steve Sheppard

There is a very simple mod to connect the chroma line on the 800XL. It
won't be as good as the 130XE picture (or the supervideo mod), but it looks
substantially better than composite output. I did this by simply running a
jumper from the R66/R67/R68 junction to the croma lead on the video port.

Also, I have found that, at least with my setup, S-video cable quality
makes a WORLD of difference in the picture I get, so make sure you use the
best components you can get your hands on!

Slor, you should be able to tell me, once and for all, what is the
default connection at pin 5 of the 800XL's video connector? It's
supposed to be composite chroma but is it actually composite video? or
or no connection?

After more reading on DOS versions, I found that MyDos had a ramdisk setup for both the 800 and 130XE. What a difference the ramdisk makes. Loading DUP.SYS or assembly source files now take a second or less to load. It's beautiful!

Also, I had to slow down the speed on my APE interface for the 800.

Usually that triple switch is for alternate OS such as OmniMon,
stock 800, OmniView or whatever the APE guy calls his. The
OS is removed from its socket and replaced with a board which
accomodates multiple switchable chips; just plug yours into one
of the slots.

2.0s and 2.5 did not support those boards; Axlon included a
utility to patch 2.0s and give a 707 ramdisk as D4 (24k waste).
I think one of the A8 magazines printed a patch to use with 2.5
for a 112k Axlon ramdisk; I recommend MyDos 4.53 because
4.50 has some kind of Axlon bug - might check with Mathy.

HD was made by Hitachi, SN escapes me at the moment but is likewise a non-important aspect to the actual workings of the circuit. Any 74LSXXX chip should be an adequate substitution as long as the XXX numbers match up. The suffix usually refers to package type and/or temperature range, you'd have to have the manufacturer's data sheet for the device or device family to find out the exact meaning, I'll assume P is plastic package, N could very well mean the same thing but coming from a different manufacturer.

No successful experiance with broken XF551 sorry.

I think you'll find the problem is the black box. I had similar results until I first copied the files to be converted from one DOS type to the other DOS into my ramdisk first. Then using XCOPY and 2.x or 3.x, the transfer is smooth as silk. Not sure why either but whenever there is BB hard drive to BB hard drive transfer attempt the data copied is trash. Only on DOS type to other DOS type transfers I might add, in order to avoid an empending flame dump upon my head. Only relief for me is make one of the drives the ramdisk and do the copy from there.

Most likely your power supply is also shot as this would be the number one reason that ram goes bad. Before you fix the ram, test your voltage from the power supply, it must be exactly 5.0 volts within few hundreths of a volt. eg. 4.98 - 5.02 would be OK, but 5.1 is not.

Failure process is too much voltage first which overheats and then shorts out a ram chip. You can find exactly which one of the ram chips it is by placing your finger on it, the bad ram chips can easily blister your finger so be careful. Normally good ram chips run a little warm, you are looking for the one or two that you could cook an egg with here.

Power supplies go bad very regularly and if it were not for the self-sacrificing traits of ram bringing the voltage back down within reason like they do, we would loose much more than a few ram chips. Always check your power supply voltage first when a ram test fails.

Mac OS X is built on Berkeley Systems Distribution ("BSD"). You get
the best of both worlds with the Mac. Besides, you could run Linux on
your Mac too, if you really wanted to. But with Mac OS X and BSD
already on the Mac, why would you want to?

Help kill the Microsoft empire: Buy Mac!

Being a Atari (800) fan and user of Macs, I can say there is no computer
more unfriendly to hook you to a Atari 8 bit than a Mac.

Granted null modem is always possible, and have done that many times, but
so often the files come out corrupted after sending from Mac to Atai.

There is no SIO2Mac ... yet.

Actually, being a Mac user in the Atari world kinda sucks right now.

This is generally why I have to wither get a cheap PC laptop to run APE
(Grrr....) or get a hard drive interface like the MyIde... of which I use
both. :)

Go for Linux. Way cheaper! Even compared to the Mac Mini. :^)

> What do you guys think?

> Only question I have is: Can the IMAC read "Mass Storage Devices" that a PC
> has written onto?

Yes, I'm almost certain. (I recently received an old G3 iMac which was
sent for recycling, and the previous owner tore out EVERYTHING, including
Safari! I had to put a copy of it on a USB keychain.)

> System today.

KDE is catching up! :^) And you cannot beat the price... ESPECIALLY
compared to OS X!

The iMac I mentioned in my previous comment (the one that was wiped nearly
clean) has the latest Mac OS X version on it (10.3.whatever).

I went to the Apple Store and it would cost me >$130< to get a replacement
disc, or have any of the old apps put back on it! <:^(

In the meantime, I've installed Debian on a few more hard drives around here
(I recently received an old Shuttle with a ~700MHz Via processor), and was
up and running in a full GUI environment in the matter of minutes (we have
broadband Internet here in my apartment), and with absolutely no money out
of my pocket! (Except the ~25c to burn an install disc ;^))

<snip>
> And it seems that SIO2PC is not also coming to the Mac.

That sucks. :^(

'atariserver' (in AtariSIO by Matthias Reichl) for Linux works quite well.
(That reminds me, I need to reinstall it!)

> But Linux is also nice if you like to do more "diving deep into the
> system".

Definitely. But then again, I set my dad up with a Debian Linux box with KDE,
and he went straight from his old Mac (running OS 8) to that system with
not a single problem.

Of course, he only uses computers for browsing the web, online shopping and
trip planning, and writing/printing letters. For people like that, Linux
(or Mac) is perfect. (Windows is asbolutely the most dangerous.)

Linux just happens to be about 100 times cheaper. :^)
($50 for a PC, $0 for the OS.)

> But you can also dual-boot Linux/PPC on a Mac. Or OpenBSD/NetBSD ....

I went to try that last night. Without having a $130 OS X disc, the closest
I was able to get to repartitioning my iMac's HDD so that I could dual-boot
with Debian was finding some $60 partitioning software for the Mac.

ugh!

(I couldn't use pdisk, since the HDD was mounted :^) ... no boot disc,
and I'm outta luck!)

960. Dance Dance Atari-evolution?

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-14 07:47:11 UTC
From: bill@newbreedsoftware.com
Message-ID: <3IYPd.6718$m31.81740@typhoon.sonic.net>
Source record: 12515

So, I was playing DDR (Dance Dance Revolution) on my PlayStation today [*],
and started thinking:

- Four directions to step on... Atari joystick port?
- Simply veritcal scrolling arrows... Atari player/missile graphics?
- Fun music to dance too... Atari demo scene?

Is there any way to connect PlayStation or PS2 controllers to an Atari 8-bit?
Or is there anything like a DDR pad that can be plugged into an Atari joystick
port?

Not counting all of the fancy flashing animations (which I honestly turn off
when I play DDR), the game itself is quite simple. There are four arrows
at the top of the screen:

< ^ v >

and a pattern of these same arrows coming up from the bottom of the screen:

```
< ^ v >
-----------
< -- step left
^ -- step up
< -- step left
^ v -- jump on up and down at the same time
< > -- now jump on left and right at the same time
```

The cascade of arrows at the bottom each hit the arrows at the top
to the beat of the music. Miss a step, or step too early or late, and
you lose some 'health.' (There's a meter at the top.)
Do well, and your health slowly goes back up.

Different songs are different BMP (beats per minute), and the patterns
vary wildly. You can choose to play light, standard, heavy, or oni ('devil')
modes, which contain different amounts of arrows that you have to step on.

The patterns they make for the songs are also graphed in their difficulty,
in terms of how 'chaotic' the steps are, how many 'streams' of the same
steps there are, how much 'air' you get (how much you have to jump), and
finally how many 'freeze' steps there are (where you have to hold your foot
on the pad for a length of time without letting up... often you have to
make other moves with your free foot at the same time, though!)

Anyway, I think this kind of game would be a cinche to make on the Atari.
Technically, the software is feasible. But we'd need two things:

* music
* a dance pad

The music we can get, I think... just bug the demosceners in the community.
The dance pad might be a little harder.

On the PlayStation, the pad looks something like this:

[select] [start]
[X] [Up] [Sqr]
[Left] [Right]
[Tri] [Down] [Cir]

the pads you use in the game are simply Up, Down, Left and Right, of course.
Other buttons are used to control the UI, but I think we could live with
the standard one button we're all used to from Atari joysticks. :^)

Our pad would be simply:

[Fire] [Up]
[Left] [Right]
[Down]

It would need 5 pressure pad contacts under/embedded-in a mat, and
then a standard 9-pin joystick cable. It's perfectly legal to hit
non-joystick comibinations of buttons (e.g. up and down at the same time,
or even all four directions at once), so dance moves like "< >" and "^v"
would be perfectly doable.

Shall we start working on this? :^)

--
-bill!
bill@newbreedsoftware.com "I'm anticipating an all-out tactical
http://newbreedsoftware.com/ dog-fight, followed by a light dinner."

[*] I refuse to embarass myself with this game in public, but it's a GREAT
way to get some fun exercise... so my friends bought my wife and I a
copy, along with two dance pads!

Never used an xf drive, but i understand that the indus GT and various 360K+ floppy boards format the same way as an xf551, that is,it formats the whole disk (front and back) whilst formatting, therefore you dont need to turn over the disk to format the back (like you do on a 1050/810)

Re: 1050 timing and RPM's, that is regulated by a timing screw attached to what looks a small brown/orange block, this is located near to were all the connections to the drive mech goes (if memory serves me right)

I have been thinking the same thing ever since I picked up feet of fury
for the DreamCast at the Austin Gaming Expo. I think that the RMT
Player code for music would be easy to use (works during vbi). The
graphics would be no problem.

I was going to reverse engineer my dance pad...which was hacked by the
DreamCast scene (a PS2 pad modified to connect with the DC).

The game could also support the USB dance pads and the USB
Carts....easy...

Could test this with a modfied joystick, too.

Away, I am up for helping to code this...I have used the RMT player in
JellyBeans (you can even import MODs with RMT), and graphics would be
simple enough...

Chris

Hmm, not sure my previous post worked, but I have been thinking about doing just this ever since I bought "Feet of Fury" for the DreamCast at the Austin Gaming Expo.

I think that the RMT player could be used easily for music (even converted MODs).

An Atari Dance Pad could be made from a modified PS2 dance pad...just need to look into how those work. The USB Cart could be used to connect a USB Dance pad as well.

Hey, I am up for helping to code this thing. I have code for the music ready to go (used RMT in JellyBeans) and simple music file selector. I will look into how to grab the beats per minute from the player to change the speed of the arrows.

I think it would be cool to make each arrow a multi-colored fuji in the four different directional orientations. You can even make this thing 2 player.

Totally. PMG could be used for the arrows, although now that I think of it,
unless we wanted to do the 8-player trick, supporting two players
simultaneously would be hard, unless the players' screens were divided
vertically, instead of horizontally.

Perhaps PMG could be used for the non-moving arrows up at the top
(they simply flash to the beat, and 'grow' a little when that pad on the
dance mat is pressed).

> I was going to reverse engineer my dance pad...which was hacked by the

True. I'd love to come up with a solution that cost less than $15 bucks
and didn't involve too many gadgets, though. :^)

> Could test this with a modfied joystick, too.

Indeed. We could even make a 'drum' version. I did this once, a LONG time
ago, with tin foil and a joystick cable. ;^)

Attach four areas of foil oo a flat panel to each of the joystick directions.
Then connect Ground to a pencil with a piece of foil wrapped around the end.
Voila! Drum pad! :^)

For the "< >" and "^v" (and other two-directions-at-once combinations),
you could simply have to sticks.

Great interview. :^) I love Dog Daze Deluxe. I spoke with Gary once about writing an Open Source clone of it in SDL, but unfortunately never had time to work on it. Since then, some folks made a Windows version, which is pretty fun (except the irritating "who let the dogs out" music :^))

Hmmm, no connection on pin 5. Now I'm confused. Dean should have seen
color on the 800 and B & W on an unmodified 800XL. Not the other way
around.

Yeah, I think it would be fine to make the scrolling arrows just character graphics, maybe antic mode 4 and use the fine vertical scroll...generate graphics at the bottom of the screen as the time comes up for it. I think that you could store "step" data to a file on disk along with songs.

> Perhaps PMG could be used for the non-moving arrows up at the top
> (they simply flash to the beat, and 'grow' a little when that pad on
the
> dance mat is pressed).
>

Yeah, PMG for the non-moving arrows makes sense, since the vertical scroll option on Antic lines make it easy and lends itself to this sort of movement.
Also, since we know that these arrows will not be moving AND side-by-side, we could maybe use half of one player (4 pixels) for one arrow. All 4 players will produce 8 columns for 2 player mode. Maybe use the full player width for one player mode. You could use the player/playfiled interaction to make the non-moving arrows appear transparent to the moving ones.... hmmm....

Use dli's to rotate some colors and viola... :)

> True. I'd love to come up with a solution that cost less than $15
bucks
> and didn't involve too many gadgets, though. :^)
>

Definitely. Cheap is better. I have a joystick here that someone modified by putting 5 push buttons on it. I could test with this thing, but there may be some simple hardware for connecting the Dance pads... dunno

This is not how mine is, but you can make something cheap:
http://devcast.dcemulation.com/mods/ddrmat/ddrmat.php

Heck, throw down four Koala Pads and you are ready to go. :^)

Looking at the PS2 controllers, it looks like they are really serial ports with 2 data bytes of serial data sent from the controller that show which buttons are pressed. It may be possible to make an adaptor for the Atari. However, it may be easier to connect a PS2 controller/dance-pad to an 850 or to an SIO adaptor....

> Indeed. We could even make a 'drum' version. I did this once, a LONG time
> ago, with tin foil and a joystick cable. ;^)

Cool idea! And cheap, too! I like it....

> Where can I learn more about RMT. (What /is/ it, for one!? :^))

Oh yeah... http://raster.infos.cz/atari/rmt/rmt.htm
I have converted assembly into something that CC65 will read for the RMT player...

> transparent to the moving ones.... hmmm....

Something like this?

```
Player0 Player1
....||||....|||| [then do the same thing again on the right
# # # with Player2 and Player3 for the other human player]
# ### # #####
#### # ### #
# # #
```

My concern with these is the level of detail. Those are pretty crappy looking, and I don't know how to better show 4 arrows using 16 pixels... Maybe some missiles could help?

Now that I think about it, if a player can only hit two arrows at a time, that means only 4 arrows need to be shown (across the screen) in the scrolling part of the display:

```
^v ^v
< > < >
^ > ^ >
v v
<^ <^
```

(Assume here that both players get the same combos of arrows, although if one player were playing an easier mode, they might get less than the other player. But in any case, there could never be more than 2 arrows at a time in each player's column.)

Use DLIs (that move up the screen) to change the horizontal position, if necessary, of the two Player's (PMGs) in each player's (human players) column, and we should be good to go.

In the above example, it'd be like this:

```
01 23
0 1 2 3
0 1 2 3
0 2
01 23
```

> Use dli's to rotate some colors and viola... :)

Totally. :^) Though even without DLIs for colors, we should be fine.
I think the animated colors in DDRMax on the PS2 simply cycle the same
for all of the arrow, except the off-beat arrows...

I hate off-beat moves, personally. :^)

<snip>
> Definitely. Cheap is better. I have a joystick here that someone
> modified by putting 5 push buttons on it. I could test with this

I have no idea what the protocol is for the dance mat, the PS2 controller...

> This is not how mine is, but you can make something cheap:
> http://devcast.dcemulation.com/mods/ddrmat/ddrmat.php

...or the dreamcast controller. :^(

> Heck, throw down four Koala Pads and you are ready to go. :^)

Ouch! You'd break them! :^)

Besides, those are 'analog' pads. :^) We just need "on" and "off"
for each of the 5 pads.

> Looking at the PS2 controllers, it looks like they are really serial

Yeah. Ick!

<snip>
> Cool idea! And cheap, too! I like it....

Not bad for a simple interface for 3 and 4 year old kids, too,
just as long as they don't zap the Atari by poking a power outlet,
or something. :)

Yeah, that does look pretty crappy. It could be like this. Notice the
space between the two players.

```
....|||| ....||||
# # #
## ### ##
## # # # # ##
## ### ##
# # #
```

But, this might be better done with a special font in Antic mode 4 and
scroll the screen. I hate having to move all the PMG vertically... but
I think that will work, too.

> Now that I think about it, if a player can only hit two arrows at a
time,

Ah good point, then the moving arrows could be PMGs with eight pixels
across for each arrow. Make the non-moving arrows from a character set
(rotate for animation). Would look cool

> Use DLIs (that move up the screen) to change the horizontal position,
> if necessary, of the two Player's (PMGs) in each player's (human
players)

> I think that will work, too.

Yeah, that costs a LOT more, CPU-wise.

> Hmm, would become complicated to move PMG every line and scroll up...
> doable, but complicated.

Well, you'd only have to do it every 16 scanlines, or so. But I think
I'm moving back to the character set with fine vscroll idea. :^)

Mayyybe we could switch the arrows to PMG right as they get to the top
(when they go to overlay the non-moving arrows).

So the top two lines of text wouldn't scroll (but would have flashing,
and sometimes throbbing (when the user steps) arrows), and the lines
below would scroll constantly.

As characters arrive at the top, they switch to PMGs, so that they can
overlap with the non-scrolling arrows above...?

979. Atari drum game (Was Re: Dance Dance Atari-evolution?)

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-15 01:09:12 UTC
From: bill@newbreedsoftware.com
Message-ID: <YYbQd.6872$m31.84829@typhoon.sonic.net>
Source record: 12534

So until we get some solution for dance pads, I think a simple
preliminary game like this could be a drum machine.

Building a 'drum-like' interface would be as simple as laying out
four foil pads on a plank, and wrapping a pencil in foil... connect all
that to your joystick port.

For folks who don't want to build even that contraption, it could be played
with a regular joystick. Just wiggle the stick in the proper directions.
We'd need to make sure no joystick-impossible combinations are required
within the game -- we just avoid Left/Right combos and Up/Down combos.

As for the music... well, it'll be a drum machine, right? Just have the
/user/ make the music. Each of the four pads (or directions on the stick)
will correspond to different drum instruments, and be played by each of
the Atari's 4 voices.

If you play poorly, the music won't sound so good, either. ;^)

I'll play with the ol' Action! cart later this week, if I have time. :^)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> examples). Afaik, they do not check the OS revision...

They may not check the ROM revision, but they may be EORing its code with the ROM contents (for "ciphering" purposes). Obviously, the checksum and revision date/number matters then.

When I saw the ROM ver. 1.03 for the first time, I did a byte-by-byte comparison with the v. 1.02 (except SelfTest, which doesn't affect the system operation normally). The only differences were: checksums, revision date, revision number and two instructions swapped in the routine initiating serial read. All of this stuff are minor differences.

Moreover, I also analyzed the 1450XLD ROM bearing revision number 2.03 (actually there are two ROMs with this revision number, I analyzed the later one) - there are more differences, but most of them are minor as well ...

Hi all!
For anyone who lives in the Toronto area, I have a 520ST with the SF314 drive and over 100 disks, mainly copies. I do not have the mouse or video cable, but it does come with some sort of dongle for the joystick port. I am not sure which program it is for. The unit does work, and it has a GEM copyright 1985.

I am looking for a direct trade for an Atari 8-bit computer with a disk drive and/or other accessoires. Preferrably an 800xl, well, anything except the 400!

If you are interested, email me at the above email address.

Thanks!
Michael

I'd take the Mac over Linux. Even if I were to go with a UNIX
derivative, I'd probably choose NetBSD over Linux. BSD is more robust
and stable than Linux. BSD is a much more mature OS too.

NetBSD is free as well.

Alternatively, look for RAM chips that generate no heat at all. If
this is the case, the problem could also be something other than the
actual RAM chips.

Wouldn't you connect pin 3 (transmit data) to pin 3 (rx in) on the
MSS1-T?

So it would be:

BB MSS1-T

Pin 3 (transmit) - Pin 3 (rx in)
Pin 5 (receive) - Pin 2 (tx out)

The rest is pretty much straight forward.

I hate using Windows. I hate using the PC. I have a very old and slow
PC that I use for very little. However, there are a few things that
can be done on the PC that I cannot currently do on my Macs.

My solution: Install Timbuktu on the PC and the Mac. I can then
control my PC through the Mac. Timbuktu mirrors the Windows display on
the Mac and lets me control the PC remotely.

It's kind of odd seeing Windows on my Mac screen but I get used to it.
The best part is that I almost never have to actually touch the PC.

This might be an old thread by now... but I thought I'd pitch in:

Locksmith 5.0/6.0 Fast Copy, Apple II+ with Saturn 128K card.. Copy 140K
disk in under 30 seconds.

This trick was done by reading sectors off the track as they came in...
their decoding routines must have been rather clever and fast. Writing
was done without formatting first, the entire track at once as far as I
could tell.

Well, I wouldn't buy anything from Apple, personally. However, as a long
time user of both NetBSD and various Linux distributions, I find Linux to
be much more "fun" than the BSD variants.

Hmmm.. the 512 mb model is $140... not much more than the iPod Shuttle at $99.... might just get it to support our sister brand. :) Anything that dares have the Atari or Commodore name on it these days makes a great conversation piece. And in my case, the chance to be different.. which is what a lot of this is all about for me. :)

What about when the supply voltage is LOW? If a PS is inadequate for
the load, doesn't the voltage typically go low? Is that likewise
damaging, or just make things get "flakey?"

Depends on the circuit involved, I haven't done any experiments on that with a good 800XL and that's not likely either but just guessing I would say that if you didn't keep it at undervoltage for very long there probably wouldn't be any serious damage. Keep it there for a long time (5 minutes?) and any section of any 40 pin chip could meltdown internally like the refresh section of ANTIC? Just a guess there but I would avoid it almost as strongly as the overvoltage situation.

Flakey might apply like when you lose SIO abilities with an 800 it's a fair bet that the PIA has gone south. I had a CPU go bad on me and you could call that flakey until it up and died completely.

I'd say we don't have to worry too much about low voltage since 1 amp power supplies seem to supply enough even for my 1 meg newell, it's just such a strain on the power supply itself that they tend to self-destruct with some infamous regularity.

REDRAVEN

1007. Get Your Holme's Atari CDs Here

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-19 22:48:45 UTC
From: "Steve S." <j70141@hotmail.com>
Message-ID: <1108853335.d74d8ac447bfa59e28dcc2b969248571@teranews>
Source record: 12462

It is that time again. Yours truly, the winner of the Holme's Atari CDs that were given out about two years ago in a drawing, is offering to send out copies of the CDs to anyone that wants them.

The Holmes Atari Website shut down about two years ago. It was the website to go to when you were looking for just about everything you can imagine regarding the old Atari 8-bit computer systems, the games, and the programs. From what I understand, the owner of the website simply didn't have enough time for maintaining it and shut it down. Before doing so however, he held a contest in which the winner would receive all the stuff that was on his website in the form of three CDs. I was the winner of this contest, and I have the three CDs. The owner of the site and the provider of the CDs has already stated that he does not mind my re-distributing the CDs to other individuals at a fair and non-profitable price.

The CDs are being provided at virtually no profit whatsoever. The cost listed provides for the burning and creation of the CDs, shipping, handling, packaging, and time and efforts involved. No other costs involved, except perhaps international purchasers, which may end up paying a slightly higher price for the extra shipping costs. (For example, purchasers from Germany and England, total cost of CDs will be $14.95 instead of the $9.95)

CDs will be burned and created at the end of the month, as the burning process takes much less time when I do it all at once. To get your own CDs, log on to www.paypal.com and send a payment of $9.95 ($14.95 for international orders) to j70141@hotmail.com

If you really really really aren't a paypal type of person, you can try emailing me and maybe I can set up a private ebay auction for you.

The last time I printed a list of the CD contents, the message was so large that many people wrote to me to tell me that the message just wouldn't load on to their computers (one directory alone takes up 35 pages in Word), but here is a small fraction of the content on the CDs (about 0.1%):

You may be right, but I haven't a whole lot of alternatives at the
present time. Besides, once I'm able to do the PC tasks on my Mac,
I'll be able to set the PC up as a file server for my Macs.

The best use for a WinTel PC is as a file server for other platforms.
The PC performs disk I/O much faster than the Mac does. At least
faster than the older Macs running Mac OS 8.6 and less.

1011. Block-moving screen memory during VBI?

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-20 11:05:52 UTC
From: bill@newbreedsoftware.com
Message-ID: <ka_Rd.7622$m31.94890@typhoon.sonic.net>
Source record: 12466

I'm guessing it's not the best idea to move ~1KB of data during a VBI, huh?

I'm starting to prototype the drum game (discussed in a thread earlier
this week) using Action!.

Nothing like spending the past 4 weeks writing 12,000 lines of codes in C
and then spending one's weekend trying to remember Action! and not hit
Shift+< (Clear) every time one wants to type an underscore ("_") ;^) :^P

Anyway, I've pulled out my books and some old code and reminded myself how
to do a plain VBI in Action!, and how to do fine vertical scrolling.
It's the coarse scrolling that's getting me. What I have works, but every
few frames, it 'jumps' a little... presumably because my VBI routine is
taking too long to copy all of the screen data.

Should I switch to a Display List 'Load Memory Scan' method, instead?
(Kind of like Itay's "IceT" fast-80-column-scrolling in 320x192 (GRAPHICS 8)
graphics mode?)

What I'll need (in both the drumming game, and the eventual dancing game)
is a simple stream of graphics. I add stuff at the bottom, and it all
scrolls up to the top. There's no need to keep an entire sequence of graphics
in memory. (I'm not scrolling over some map in a shooting game, in other
words... I just want an endless stream to flow, like one would get if they
were typing in the Atari E: edtior and hitting [Return] a lot ;^))

oy I've been up way too long. Any tips appreciated.

And special thanks to Matthias Reichl for AtariSIO for Linux. ;^)
(I got it compiled on my 'new' 2.6-based system without any hitches,
once I grabbed the appropriate 'kernel source' and 'kernel header' packages
from Debian!)

I can't help you with the VBI, but I was just wondering why you don't use CC65? You can write most of your code in C using tools on the PC (Windows or Linux), test them in the emulator or on a real machine via SIO2PC. You can mix assembly and C easily so writing VBI routines in assembly and linking that to your program is very easy.

Could be a little bit tight :-)

> Should I switch to a Display List 'Load Memory Scan' method, instead?
[...]
> What I'll need (in both the drumming game, and the eventual dancing game)
> is a simple stream of graphics. I add stuff at the bottom, and it all

I guess the display list method is the way to go. Basically, you'll need
to arrange the screen memory in a ring buffer. With 3 display lines
it would look like this.

Display lines 0, 1, 2 and draw line 3. Now change the display list:
display lines 1, 2, 3 and draw line 0. now change again:
display lines 2, 3, 0 and draw line 1, etc...

You can even avoid changing the LMS addresses of the whole screen by
pre-computing all display lists. Then you'll only need to change the
display list address in the VBI.

Or, if you want to save some memory and can live with 2 blank scanlines
before and after the playfield, set up a special (secondary) display
list like this:

Mode+LMS address line 0
Mode+LMS address line 1
Mode+LMS address line 2
Mode+LMS address line 3
Mode+LMS address line 0
Mode+LMS address line 1

Your "primary" display lists contains everything but the playfield
display list, instead of the playfield display list data add a
jump to the beginning of the secondary display list. Then, change
the 4th entry of the secondary display list to "jump to the rest
of the primary display list".

In the next step, change the jump in your primary display list to
the second entry of your secondary display list, restore the 4th
entry, and change the 5th entry to "jump to the rest".

I think you'll get the point :-)

> And special thanks to Matthias Reichl for AtariSIO for Linux. ;^)

You're welcome!

so long,

Hias

Looks very interesting. But of course, we'd need a 65816
cpu/assembly. There have been several versions of these developed.
Some appear quite simple, and others require many more components. I
know the Turbo816 worked at least in 800XL's -- saw it, touched it,
etc. I have "heard" that the Sweet 16 worked well in some
installations and not so well in others. Can anyone bring the group
up to date on this subject? Is there somewhere to actually buy a pcb
for the cpu conversion? Or actual plans/schematics?
-Larry

I'm not sure I understand what you're trying to do. You say that you
add stuff at the bottom and everything scrolls up. I'm not sure if
you're wanting everything to scroll up or you're not wanting everything
to scroll up.

Is it that you want to create two virtual screens on your 8-bit display?
i.e. one portion of the display would remain virtually static, with very
little change in the display? I'm not sure I understand your problem.

You mention moving 1KB of data. Would this 1KB of data be display data
or something else? I'm assuming your 1KB of data is display data. If
this is correct, you want to move this data while the screen is
redrawing and you want to know if moving the data during a vertical
blank is the best way?

You want to do smooth vertical scrolling of graphics? On the entire
screen or just a portion of the screen?

I'm not entirely sure that I understand what it is that you're
attempting to accomplish.

I wonder if you'd be willing to create some disc images and maybe offer them via bittorrent or other such P2P means? I've seen many other roms and such on Bittorrent and elsewhere and I think it would be a great idea to maybe get some of those 8-bitters sitting on the fence back into some retro as well as introduce the fun to those interested in emulation, or perhaps the real thing.

It would be great if you are able to that for the Atari Community.

- Revan

1020. Re: Get Your Holme's Atari CDs Here

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-21 03:11:28 UTC
From: "Steve S." <j70141@hotmail.com>
Message-ID: <1108955488.136206c9bf06eb9571374d09b4c6dc38@teranews>
Source record: 12475

Actually, I have had some ideas about that. At first, I was thinking of putting the contents of the CD on to a website, and give it an interface similar to the Holme's Website. Reason being, he had just about the best there was. I was going to write it in PERL and allow it for automatic update, whenever a new program is added, thus keeping maintenance down to a minimum.

Then, I found this website here... http://atari.online.pl Which, although not written in English, appears to have ever single software for download on the website. Now, I am not so sure that making another website is the answer. Give this one a try, just click on one of the directories and see what they have.

In any case, as part of the site that I was thinking of building, I thought of making available the images of the CD. The issue here however is the bandwidth. This CDs are huge, a little over 2 gigs for all three CDs. I have DSL myself, and I recently downloaded only 1 gig, and that took most of the day. It would truly suck if I had them available to anyone at any time, imagine 5 or 6 people or more downloading from my site for most of the day. That would really suck in bandwidth and may become expensive on my part.

What I have thought of is charging for the download, like $5, while keeping the separate downloads available for free. This should keep traffic down a bit and allow access to the website. I could even allow a 'waiting list' for those that want to download, and let them download in a queue while keeping bandwidth issues to a minimum. In any case, I would need a way to restrict downloading, either through charging or queue or some other way. I am not really sure yet.

As for a P2P system, you can try it yourself, but it seems like a bit of trouble. The files are just way too large and getting the first few copies out would take nearly forever.

Glad to see that you are still around and distributing these CDs! I think
they are a REAL asset to anyone's collection, especially those that are
serious about it as I am! I want to get a set for my collection!!

Unfortunately, I can't do PayPal and so I sent you a personal email... so be
sure to reserve a set for me!

Thanks,

Nite Hacker

NOTE: That there probably is a bigger collection than the one you referred
to. It's the CTH/Spudster.org collection! You can reach it here
ftp://spudster.org I believe, so far, this is the biggest repository left
on the internet now! VERY unfortunate that Holmes left the scene!! :-(

1022. Atari 800 XL - need help!!

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-21 05:33:37 UTC
From: "kafer77@ameritech.net" <kafer77@ameritech.net>
Message-ID: <1108964017.828890.44420@c13g2000cwb.googlegroups.com>
Source record: 12478

I just purchased off Ebay an 800XL, 810 floppy drive, power supplies and cables. However, I only got photo copies of a manual (?) for the earlier 800 model - nothing for DOS. All I have for the 800XL is the "getting started" pamphlet for an XL. (I purchased this revisit basic and machine level languages - about 30 years after I first owned a TRS80-Model 1. So, consider me a complete "newbie" to the Atari world.)

I have some questions:

1. I understand that DOS is in ROM on the 800XL motherboard & that the older 800 required one to boot up from the dos disk through the 810. If the DOS is in ROM for my computer, how do I activate DOS?

2. IF I already have what I need to "talk" to the 810, then what are the steps for - let's say, saving a program to the 810??

3. Where can I get copies of whatever manuals would have accompanied the 800XL and 810 drive?? I particularly need the DOS manual.

I can really use the help!!

Chicago Pete

Only Basic is in Rom, DOS is on disk.
>

You need a dos boot disk. Single sided single density for the 810 FWIR.
Yup, http://www.faqs.org/faqs/atari-8-bit/faq/section-20.html. I only
had a 1050, which I used Dos 2.5 with.
>
> 3. Where can I get copies of whatever manuals would have accompanied
> the 800XL and 810 drive?? I particularly need the DOS manual.

Dos requires a little reading. Do you have any disks for the 810?

Here is some light reading.

http://1000bit.net/support/manuali/atari/Atari_DOS_2_5.htm

and some more manuals

http://1000bit.net/support/manuali/manuali.asp

Google is you friend;-).

I hope some of this will point you in the right direction and Good Luck!

Welcome to the world of Atari 8-bits!

It may be overwhelming, but you could look at the following in this forum...

Welcome to comp.sys.atari.8bit! - Michael Current
Atari 8-Bit Computers: Frequently Asked Questions - Michael Current
Atari 8-Bit Computers: Vendors and Developers - Michael Current

If you can't find them, use Google Groups to go back to find them. They are published semi-annually and the last time they were published was in August of 2004. So a new version should be coming shortly! Meantime, you can probably find them on Google!

The DOS resides on a disk, always has! NO part of DOS resides in ROMs on any of the Atari computers! You need a DOS disk such as DOS 2.5, SpartaDOS, MyDOS. Nowadays, MyDOS is highly recommended, especially if you use a PC emulator. However, SpartaDOS is really good too and has some similiarities to the old M$DOS and may be easier to understand and use!

To activate, just use an 810 or 1050 disk drive, turn it on, and put the DOS disk in the drive and then turn the computer on. Most cases, you will go to a pretty much blank screen with a 'Ready' and you have to key DOS and enter to go into DOS mode. Some DOSes may boot up a little differently but I don't want to confuse you right now. Anyways, when you key in DOS, you will go to a menu for that DOS. When you are done, there is an option in the menu to exit back to the BASIC mode. You mainly use DOS while you are programming, such as in BASIC, or you are doing file management stuff. Otherwise, if you are just playing games, you just put the game disk into

the drive and hold down Option key to disable BASIC while turning the computer on and the game should load. There are some exceptions to this too, but, generally, most games are booted this way!

> 2. IF I already have what I need to "talk" to the 810, then what are
> the steps for - let's say, saving a program to the 810??

Unfortunately, you will need to read DOCs to learn more about how to use an 810 drive or 1050, etc. Saving files to the drive depends on what kind of files they are. So to learn how to use or save different file types, you need to read DOCs on BASIC and DOS and how to use your computer.

> 3. Where can I get copies of whatever manuals would have accompanied
> the 800XL and 810 drive?? I particularly need the DOS manual.

As mentioned, you should be able to find DOCs on the internet, to just about anything you need... computer, DOS, BASIC, etc! I don't know of any right off hand but I am sure if you spend some time on Google, you'll stumble onto something! Just use keywords like: Atari, 800XL, etc. Unfortunately, if you REALLY want to learn about this system, you'll have to spend several hours on the internet to find the info you need! When you find a site, look for the Atari 8-bit Ring and use that to find other sites related to the Atari 8-bit which is what most of the Atari computers are referred to. Unfortunately, you CANNOT learn the 8-bit overnight! You'll need ALOT of patience, BUT it's worth it!!!

> I can really use the help!!
>
> Chicago Pete

For a good head start, you could go to this site and find stuff for your NEW Atari... ftp://spudster.org

Or use this search engine especially designed for Atari 8-bits... http://www.newbreedsoftware.com/xlsearch/ - You'll find the Atari 8-bit ring at the bottom of this page and can go from there, if you like!

I just wanted to make a note that I ordered a set of these CDs from Steve and received them more quickly than I thought I would and the transaction went off without a hitch. If you have any reservations sending money out to someone you aren't familiar with, don't worry about it.

Sean

Yes, TBXL and SDX will co-exist in modified XL's or XE's with at least 128K.
Evidently SDX can be configured to "USE BANKED" memory instead of "OSRAM".
I had forgotten about that.

Actually, the DOS for all Atari 8-bit systems is on disk. The only exception, I believe, is SpartaDOS X, which is on cartridge.

In order to use your disk drive with the Atari 800XL, you will need to get yourself a copy of DOS. You can get a copy of most Atari DOSes on the Internet. You will want at least Atari DOS 2.0 or one of the many third party DOSes like SmartDOS, SpartaDOS, MyDOS, SuperDOS, etc. You should stay away from such ill fated Atari DOSes such as Atari DOS 3 or 4.

The way you load a basic file from an Atari 8-bit computer is thus:

LOAD"D1:FILENAME.EXT" or LOAD"D:FILENAME.EXT"

In the first example, the number immediately following the "D" is the drive designator and can be any number between 1 and 8. You can omit this number, however, and the Atari will assume that you're requesting or saving a file to drive 1.

Likewise, to save a basic file on the Atari, you would use the following command:

SAVE"D1:FILENAME.EXT" or SAVE"D:FILENAME.EXT"

It is important to note that the Atari 8-Bit uses the same file naming conventions as MS DOS for the PC did. i.e. an eight character filename followed by a period and a three character extender. Examples include:

FILENAME.TXT
FILENAME.COM
FILENAME.BAS
Etc.

You may also wish to look into getting an Atari 1050 disk drive for your Atari 800XL. The 810 is only a single density disk drive. The 1050 used a format that Atari users refer to as "Enhanced" density. It was Atari's bastardized rendition of a double density disk format.

As for manuals, I cannot help you there as I have no idea where you might find them. You may, however, be able to find PDF copies of the manuals on the net by doing a Google search.

Atari 8-bit New User, Emulator Help FAQ (Bill Kendrick)
http://www.sonic.net/~nbs/new_and_emu.html

You might want to get a APE cable, it will simplify getting a DOS to your
computer. An APE cable is a PC serial to Atari SIO interface to allow you
to use your PC as a disk drive for the Atari.
Your problem getting started, as I see it, is you don't have any disks for
your drive. I'm sure people would mail you a disk, but the APE cable would
open the entire world of A8 to you.
Just a simple instruction, assuming you got a DOS disk (I suggest
SpartaDOS),
you could write a program in Atari BASIC, from the 'READY' prompt.
Then save it with 'SAVE MYPROG.BAS'.
There are some pretty good vendors for the A8, in case you want to buy
something, the vendor list is a little big and difficult to figure out which
one is the most likely to have what you want.
Steve Tucker's APE cable and software, you can get a somewhat disabled
version free from www.atarimax.com.
Steve also sometimes sells a really neat APE/PRO interface on ebaY, I have
one and love it.
The spudster page I see referred to isn't correct, I think and spudster
seems to be busted right now. I think the correct page is
ftp://ftp.spudster.org.

Hello. I can't download anything from it. I can navigate the CTH folder,
but once in a sub-folder, I can't download anything. If you can, then I
guess my IE 6 ftp isn't working. I think I tried a simple ftp client also
and couldn't download anything. Maybe you could give a try to download
something.

I don't use IE much anymore. I use TotalCommander instead. I believe, If you want to download in IE, you will have to hi-light the files you want to download and right-click on them and select 'Copy to Folder'. They DON'T work like a direct download link does!

Well, I was messing around, there does seem to be some problems getting to the files! I think they limited access and so it's harder to get on or to get to the files! Probably TOO much leeching going on?

I did get on once with Total Commander, but looks like maybe my IP got banned or locked out so now I can't get on now?

Looks like you might have to use an ftp client to get on now, such as Total Commander, etc.

As you said, I can't get through by using IE either, but I *DID* get on with Total Commander and was able to download a file so it is working to some degree!

I am having slight problems with Total Commander too, it has problems with getting the directory. However, it does get it after I abort the directory command. Then I *CAN* select and download a file. However, I don't know if the directory is complete since it doesn't finish and I have to abort from it? So, I don't know what's going on with this site now!?!? Maybe Tom Hunt might know?

IE must be blocked or something is wrong? Because, like you, I can't get through using IE6 either! Then after a period of time trying, it locks me out (anonymous) and requests for a username/password and stops accepting the anonymous login!!!

Something is wrong... but who knows!?!?

```
There was/is another site that has/had the CTH archive.
I can't log in however. Maybe there's a password I'm not aware of.
The site is ftp://a8@xp.ivn.cl I can't get it to work either.
I can get to it using DOS prompt 'ftp', 'open a8@xp.ivn.cl', but I can't
successfully log in. Maybe it is a private site. I'm not sure what country
'.cl' is.

Can someone please direct me to web site (or sites) that shows exactly how to transfer data from an Atari 800 floppy disk to a modern PC? Thanks!

Cagey Bee

What is it that you want to transfer? Is it data/programs that you
created yourself? If not, why even bother with a transfer? Chances
are very good that you'll be able to just download the files you want
from the net. When you consider the very small file size of Atari
8-bit app's and games; you could probably download an entire Atari 8-bit
software library in a matter of hours.

However, since you did ask about transfering files from your 8-bit to
the PC, I will do a quick search and get some results for you.

Probably the best way is to find someone to do it for you.
Or, you could get a APE or SIO2PC cable and do it yourself from your
own disk drive and A8 computer. There is also a 10502PC interface, that
will let you read a A8 drive on the PC, I think.
If you're thinking there's a way to read the A8 disk in a PC, it isn't
likely.
Most likely your disks are single density, which isn't likely on a PC.

1043. Welcome to comp.sys.atari.8bit!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

XF uses the timing hole for formatting but HOW do 1050 and Indus GT format
without the timing hole? I dont see the timing hole inside both 1050 and GT.

1045. Re: Atari 8-bit to S-video cable question

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-22 07:32:00 UTC
From: "Rick D." <a8maestro@a8maestro.com>
Message-ID: <421ADFF0.574236E9@a8maestro.com>
Source record: 12400

Hello,

While I can't offer any info on the pal problem, a general suggestion is to try the TVs with some other svideo device, a vcr or camcorder.

Do the A8 computers have the same display using RF or a regular composite monitor?

What quality of cable are you using? How about shielding the lines?

The monitor jack pinout clockwise is luminance, video, ground, chroma(not XL), and audio. Svideo normally goes to luminance and chroma, but will work with luminance and video. I have found that the other two svideo pins goe to a common ground with the shield.

Rick D.

1046. DNS'er Site

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-22 15:44:04 UTC
From: Greg.Goodwin@family-news.org
Message-ID: <739417.564d82@fmlynet.org>
Source record: 12402

At the moment there is a new site for the UDS-10 users and others have have trouble with sites that have a changing IP address.

Thanks to Oak of JYBOLAC we have a new site where you can look this up. It is in the alpha stages and feedback is encouraged.

The IP to check out is..

198.136.234.38/4242

Once there (you might have to try a few times) it will give a prompt saying:

DNSer>

... at that point put in the DNS entry (IE. "Google.com") and rather than hitting enter, press control+J.

The site will look up the DNS entry, and spit back an IP address. After that it will say goodbye and log you off. At which point you are able to enter in the IP address that it gave you and go to the BBS as usual. As you have probably found out by now, BBS's with "Dtdns", "no-ip" and other hosted domains have a IP that will change every ten minutes. So once you get the IP address from the DNSer, use it as soon after as possible.

Oak says this was a very simple 2 K script (about 10 lines of code) that he was happy to do as a diversion from his regular IT work he does on the college campus he works for. Oak is even wanting to look at a Atari 8-bit to see what tinkering he can do with it. That could be... interesting. :)

But as I said, he encourages feedback, and said to write me (Doctor Clu) at drclu (A T) swbell (D 0 T) net for feedback. He wants to add more to it, like a top ten list that could be selected with the hitting of numbers 0-9 and other things such as that.

Remember, whatever suggestions you give remember that the point of the DNS'er is just to look up a DNS entry and get an IP address. It is a tool for UDS-10 and other users that are not able to look up DNS entries normally. (We thought about forwarding, but figure that could be abused) :)

Well, as a UDS user myself, I am glad my friend made this for me and hosts it. He is worth the 17,000 student loan I took to meet him in college. :)

Take care, and give those feedback, bugs, and suggestions so that we can improve this for the Atari BBS community.

Doc Clu

Wow! Are there any more of these from your source to "stumble upon"?
I could use a couple, but $$$ is tight and others probably need them
more... but I know a group of cheap bast^H^H^H^H users who might part
with some $$$ if the source is large enough.

Ben

That's the beauty of Bittorrent. Two gigabytes wouldn't even break a sweat,
I use it to download Linux ISOs all the time. Check it out at:
http://bittorrent.com/

And a very good client here:
http://azureus.sourceforge.net/

I want to know about HDI. What OS is allowed to use HDI ? Can it boot from 3.5 disk drive? Any IBM 3.5 inch or 5.25 inch drive can fit with HDI? Where do I buy HDI?

Thanks!
Jack

I think that this user *MIGHT* run into a problem.

This data was saved by a program (some kind of database) that probably
did not save the information in ASCII (or ATASCII) format. It,more
than likely,is in a proprietary format

I hope that this is not true,but if it is,he will need the original
program to recover the data!

I can't help you with this one. I have read the answer while I've been Googling but I don't remember... It had something to do with using the position of the first track or the first sector of the first track for timing... ??

> The site is ftp://a8@xp.ivn.cl

It DOESN'T seem to work in the browser so it looks like you have to use an ftp client!

Well, I tried it and it's there and looks like it is password protected! I tried to get in using my ftp client and says a password is needed for anonymous. I tried several different logins with NO success! You have to find out from whomever is running this ftp what the login would be... *IF* they even want someone to login!

I think CL is Chile. The server returns info in spanish so that would make sense! Here is a country code reference list and is probably what is used by the internet...

It's NOT totally impossible! If you have or can get an older computer with a 5.25" drive (older models?)... I think there was a program that claimed it could read your Atari disks! Don't remember what it is or if it's still on the net, I will have to look and see what I can find out about it.

I found these links on the web I am not sure if this is exactly what
your are looking for but here is my 2 cents.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=1247&item=5167320044&rd=1&ssPageNam
e=WDVW

The above link is a ebay auction that has both a SIO2PC and 10502PC
cables all made up for you. I hought my sio2pc from this fellow, and it
arrived fairly quickly considering it is coming from Poland. Very
nicely assembled.

Also the link,
http://j131atari.webpark.pl/arfd.htm

or the one on the auction page walks you through on how to read atari
disks to your PC. I have not tried this but I will be purchasing a set
of cables 10502PC in the next few weeks.

I collect the Atari 8 bit carts and I have around a 100 or so and I was
curious has any one tried copying the carts. I know it is possible, as
I have seen a tool years ago that did this, but I would like to know
how this is exactly done, what tools I need etc.

Any suggestions would be greatly appreciated.

Thanks,
Chris

snip
(Copy A8 carts).
Sure. Get a Omnimon OS. It is then possible to interrupt the cart and
enter the monitor. It is then possible to dump the cart to sectors on disk.
It is then possible to extract those sectors to a file. It is then possible
to burn the file to another cart using an EPROM burner. OR, it is possible
to modify the file so it will load as a binary load file.
Better yet, just about every cart ever made is already 'cracked' and
available at a few sites, or buy Holme's CDs or buy from a dealer, (dealer
would just have the cart, not a load file.)

Most PCs are quite capable of reading and writing to a single-density disk. A lot of them cannot FORMAT such a disk. It is just a matter of trying it.

Thanks for the above reply,

Is there a FAQ or link on the above process and how hard is it to get
the Omnimon cart?

I have quite a bit of 8 bit stuff that I have continued to collect over
the years not to mention what I had when I was a kid.

I believe I have the Holmes CDs already...I will check tonight when I
get home from work...If not I wil purchase them tonight.

I want to learn about the above process for a learning experience.

Thanks for any other information you can supply,
Chris

Hello,
I am a old Atari 8 bit user that is getting back into the Atari scene
and wIth the above discussion about OS I have a few questions about the
different OSs out there.

1) Which OS is the most popular?

2) What are the advantages of the Cartridge OSs?

Suggestions on the OS that I now should use is greatly appreciated.

Thanks,
Chris

For Atari single density disks I used to Anadisk 2.06 combined with DEANA (De-Ana). Can only copy from Atari to PC with these programs and there is no error detection/recovery. You need a 5.25 inch floppy on the PC. Produces Xformer files which are easily converted to ATR files.

For double density disks I used Matthias Reichl's (sp?) wonderful utility called WriteATR. It can copy in both directions. Uses ATR files.

Both processes produce disk images files on the PC. You need some other utility or emulator to access file on the disk image.

If you just want to transfer Atari files to the PC then Dskutil (name simply Util.exe) comes to mind (sorry no link). Double density Atari diskettes are required and a 5.25" floppy drive on the PC.

I used all of the above utilities until I got my second SIO2PC cable. Now I use APE and SIO2PC software for transfers with a direct connection. (Though, I still use WriteATR because it is so slick).

By the way, I second the vote for cables from Artur Burzynski (sp?), the gentleman in Poland, mentioned elsewhere in this thread.

Although my first cable did not work because of incompatiblities between the 1-chip, SIO2PC design and my ATR-8000, the second cable (2-chip design) worked great.

Artur was very accommodating. Gave me several suggestions to try to fix my problem with the ATR-8000. Explained some mods for the original cable to try. Sent me the second cable (no extra charge) while I was playing with the first. Told me to experiment all I want. If one cable worked out then I was to send back the other. Otherwise he was willing to give me a full refund. I couldn't ask for anything more than that. He does nice work too. The cicuit is fitted inside the Atari SIO shell so there are no breakout boxes or exposed circuit boards. Just a clean cable.

If you run out and there is still enough interest, I can get these in
quantity and resell at cost. Depending on the number, it'll probably be
about the same price, and they're NOS units like your find.

> The only other supplier I could find with NOS 360's were

Isn't it amazing how much prices can differ on things like this? There
never seems to be much rhyme or reason on pricing of older equipment like
this.

The Omnimon documentation isn't real easy to follow. I don't know
who sells the Omnimon OS. You buy a multi-OS that plugs in (if you have
socketed ROMs), to the ROM socket. Omnimon was by Newell, and I think the
multi-OS board was called a RAMROD. You could try Video-61, Best,
www.myatari.com, B&C, Ben Smith, one of those may have some RAMROD/Omnimon.
There were other cart copy ideas, 'Impersonator' was one, you'd boot up the
software and then plug your cart in, and then dump it, and use a 'dummy'
cart to run the resulting file. I don't like the plug/unplug cart ideas
much. Maybe www.atarimax.com has a multi-OS board and Machine Language
monitor that works.

Copy protection is an intense subject. It is nice to know somethings about
the way it was done in the A8, many principles are the same today. I've
been dealing with modern ink-jet printer copy protection today. Refilling
ink carts.
New inkjets come with a chip in them to prevent you from refilling them.
Probably not so new, my newest printer is probably 6 years old. The Digital
Millineum Copyright act is a factor today, it wasn't in 1984. It may even
be illegal to discuss copy protection defeating in a news group. (Ewwwwwe,
that's fun.)

If you want omnimon you should go the way of atarimax.com, now, if you
wanna write and read Atari disks on pc you can use Util, it works
pretty well...
It is available at the UMICH archive. On the other hand i just got my
APE-SIO/PC interface, so no more util for me, at last my drives will
rest a while...

I really like and think there is *NO* better emulator than the Atari800WinPlus series!!! BTW, it's for Windows.

Question, though, which version is better??? They keep trying to make improvements to it, but, in my opinion, it has been sliding down the hill some ever since the original programmer stopped programming on it! Features have been changed or taken out that I have liked in the previous versions, etc, and cosmetic changes which I don't like and other issues!

I don't remember the last version that I was using that I really liked and was comfortable with? I think it was 27 or 27b? BUT I don't think it has some of the features that were added in a later version such as playing over the internet, cheat trainer, etc.

You can go here to get *ALL* of the versions created in this series and then decide for yourself what is best for you!

http://atariarea.histeria.pl/PLus/index_us.htm

It may be down right now? When I checked it, it didn't come up so keep checking! I just recently downloaded from there, though!

Have Fun!

Nite Hacker

BTW, does anyone know if they are still working on this project or has it kinda died out now? I see that the last version was 31 and it hasn't changed for a few years now? If they are still working on it, is there a way to contact the main project leader, etc, with suggestions or corrections?

Actually, this thread is really about DOS and not the OS! SpartaDOS X is a DOS on a cart! OS is still on the computer and is still used even when you boot this cart so the OS is just the standard OS on the computer. There is *NO* OS on this cart that loads to the computer. I don't know if there is a cart that loads a different OS... is there? I think the OS *HAS* to be modified in the computer instead?

As far as OS, there are a couple mod OSes that alot of people have liked or used... such as the Omnimon/Omniview (most common/preferred)! I think there was another one too? There are a *BUNCH* of mods... for the OS, Pokey(sound), Video, RAM, etc!!! I knew of someone who could do this mod and just about any other mod that you wanted! I don't know if he's still at the same address or not? I kinda want to try and look him up someday BUT I have a strong feeling that he's probably not doing much nowadays... if anything... if he's still around?

I was hoping to get some straight answers from this group, but that hasn't happened yet. Some of you say it isn't possible, some of you say it is. Some say I need special cables and software, some say I don't. Some say just pop the disk into a 5.25" drive and all will be well, others say that won't work. And even if I get the data over to a PC, some say it will be usable, others say it won't. Which of you am I to believe?? Can someone please give me a definitive answer?

If any of you brainiacs live in NE Indiana, let me know, and I'll turn the client over to you.

Here you go.

http://www.a800win.atari-area.prv.pl/

Last update (ver. 4.0, beta 3) is now a year old.

I'd like to see some tweaks for PC joysticks. Gaming is much more difficult with Atari800Win Plus than with the real thing, at least with my PC joysticks. They all seem too sensitive to direction changes. False movement is very common and annoying. I think it could be fixed by allowing threshold adjustments.

I'd also like to see the indirect ATASCII to ASCII conversion (via H5: thru H8: drives) handled better. Right now it only converts Atari EOL (dec 155) to CR (dec 13) and vice versa. Doesn't deal with proper CR/LF's. The LF's (dec 10) (linefeeds) become a problem. When importing files via the H5: thru H8: drives the LF's get left in on the Atari side and LF's are not valid in the Atari environments.

I think the manual conversion utility works correctly but I'd rather just drop ASCII files into the virtual hard disk (a subdirectory) and load the files from within the emulated Atari.

Atari800Win Plus does support drag and drop of disk images and binary files but only for Drive 1. I'd like to have drag and drop for other drives.

Reading real Atari disks would be nice. Would be great to see something like DskUtil (Util.exe) and 1050-2-PC functionalities incorporated into Atari800Win Plus.

Hi all,
I consider myself a newbie since I have not used my atari's disk/or cassete system for quite some time. I have a few questions concerning when and when not to use DOS.

1) When do I use DOS?
2) What File Types extensions do I use in DOS (or when the DOS program is Loaded)?
3) What File Types do I use when not in DOS (BAS?)
4) What File Types are there out there?
5) What is the difference between the OS (on the Machine 800XL) and the DOS on the Disk?
6) Some common commands to Load,Save,Delete files on DISK and CASSETE?
7) Can #6 (DISK) be done only when the DOS program is loaded?

Please do not be afraid to go to technical as I have a Bachelors in Computer Science but I have not used my Atari system activily other then to play games since I was about 10 and I am 30 now.

Thanks for all you help everyone,
Chris

> when and when not to use DOS.
>
> 1) When do I use DOS?

You will need a DOS to be loaded into memory and time you want
to access a DOS filesystem on disk, which is basically all the time
except when you are booting a self-booting game/utility disk.

> 2) What File Types extensions do I use in DOS (or when the DOS program
> is Loaded)?

If you are in the 'dup' menu of dos using the 'L'oad function,
typically you would use EXE/XEX/COM files, which are segments of code that
are loaded into memory, and optionally run.

The other functions of the dup menu are general purpose and generally
can operate on any file type. (Copy, Delete, etc)

> 3) What File Types do I use when not in DOS (BAS?)

It depends on what you have running on the computer. To you any type
of files at all from a disk, some type of DOS system will have to be present
in memory to provide the CIO D: handler.

If you are in BASIC with DOS loaded, you can load/save .BAS files. If
you are in Action! with DOS loaded you would be loading saving .ACT files, etc.

> 4) What File Types are there out there?

The EXE/COM/XEX and BAS files are the most common you will come across.
The extensions are arbitrary, so you will find files with every extension
you can imagine.

> 5) What is the difference between the OS (on the Machine 800XL) and the
> DOS on the Disk?

The Atari OS only has support for loading and saving raw blocks ('sectors')
to disks. To do anything more complex, like build/read a filesystem, you
need DOS loaded into memory to provide the 'D:' CIO handler.

> 6) Some common commands to Load,Save,Delete files on DISK and CASSETE?

To load a binary file from Atari DOS (or other Atari style DOSes) you
use the 'L'oad option from the DUP.SYS menu. Outside DUP.SYS you will need

to use the D: CIO handler in whatever way your host program supports. In BASIC it is:

LOAD "Dx:PROGRAM.BAS"

Where 'x' is the drive ID number, typically 1. Cassette loading and saving
is done in basic using the CLOAD and CSAVE commands.

> 7) Can #6 (DISK) be done only when the DOS program is loaded?

Yes. Cassette support is built into the OS.

Steve

1086. Re: XF551 read/write IBM 360K disk ???

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-24 19:07:00 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <421E25D4.383552F0@students.uni-mainz.de>
Source record: 12440

Well,
the Atari software written to read a 180k or 360k or 720k IBM diskette
on an Atari floppy is always READ ONLY. Have not seen any Atari software
that would be able to write to an IBM formatted disk. However, there are
some polish floppy drives (TOMS and others) that can read+write+format
Atari densities as well as IBM densities, but they have special hardware
and Floppy-OS inside... -Andreas.

1087. Re: XF551 read/write IBM 360K disk ???

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-24 19:11:53 UTC

Message-ID: <421E2914.745AD0C9@students.uni-mainz.de>
Source record: 12442

Well,
since turbo Basic was once published as a type-in listing there were no
big manuals or documents available. but many Atarians (including english
speaking Atarians) provided helpful information on how to use TB XL,
what statements or commands are available, etc. etc. Think I have a
sort of doc. by Ron Fetzer in my collection, as well as a TB Compiler
with english (instead of german) on-screen instructions... As always:
if you are interested in this stuff, simply e-mail me and I will send a
zipped ATR image in return. -Andreas.

1089. Re: SpartaDOS 32g & XF551; Hyper-XF

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-24 19:34:11 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <421E2C33.4413985D@students.uni-mainz.de>
Source record: 12443

Well,
this new OS for the XF551 drive was once sold here in Germany by the author himself, Stefan Dorndorf. Alas, he no longer does. Luckily I have copies of the two ROMS available on diskette, so if you know how to convert some ML files to BIN (eprom-burnfiles), here you have a go. Two ROMS? Yes, one for 5,25" drives and one for 3,5" drives... e-mail me if you want them...

The lockup problem of the XF551 afaik only occurs under DOS 2.x derivatives, not under Sparta and compatibles. With the Hyper-XF-OS this lockup problem is almost solved/gone. The german manual also mentions the possibility of adding a switch to have an automatic density detection (like the 1050) with all available densities. Finally all floppy commands, as well as speeder commands (including XF551, Hyper-XF, Speedy, Happy, US-Doubler, Turbo) and copy protection commands are explained in this manual...

Now I need someone who can translate this manual into english language (I am not too lazy, the mentioned floppy, speeder and protection commands are greek to me, thus I cannot translate nor describe them). and er well, the manual is on paper, so I need someone to scan it or type it in, if that has not already been done somewhere... -Andreas.

1090. Re: XF551 cant format side 2 disk!

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-24 19:41:39 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <421E2DF3.8D271F8D@students.uni-mainz.de>
Source record: 12444

well,
the XF551 is (almost) a stack industry drive. And like all 5,25"
industry drives it uses the index hole. Meaning, if your 5,25" diskettes
do not have two index holes, you cannot use them as flippies (as you did
with the 1050 or other drives). If you are lucky and have a Mitsumi
drive, you can simply format side 2 on another drive (810, 1050, Rana,
Indus, etc.) and then read/write this formatted disk with the XF
drive... Of course there is the possibility to a) use both sides of the
disk at once (double-sided double-density = 360k for instance), thats
what all PC floppies did or b) build and install a sort of index-hole
redirection. Here in germany ABBUC has schematics for such a thing
available. Afaik in the US several vendors (Best, CSS, etc.) do still
sell this thing... -andreas.

1091. Re: Sparta Dos XCOPY?

Source record: 12445

Well,
for the purpose of converting files from Sparta to Atari format I simply use the Menu.COM file. It can read Atari formatted disks and write the files onto sparta disks as well as the other way around: read Sparta disks files and write them to Atari DOS 2.x disks... Afaik the SpartaDOS Menu.COM program supports Single Density or Single and Double density but no Enhanced density. Thats why I always use the Sparta compatible BeweDOS and its Menu.COM file for that. It reads/writes SD/ED/DD Atari DOS 2.x and Sparta disk files making the conversion process very easy... -Andreas.

1092. Re: Sparta Dos XCOPY?

Newsgroup: comp.sys.atari.8bit

Hmmm,
well, I do not have Sparta DOS X cart, but someone said TB XL would not work with it... so now what ?!? Does TB XL work with Sparta DOS X cart or not ?!? Maybe that guy (who said it does not work) bought the Sparta DOS 3.3 cart from Video 61 ?!? OF course then it is obvious that TB XL will not work with it... -Andreas.

1096. Re: Where do I buy HDI?

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-24 20:32:42 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <421E39EA.281D91D7@students.uni-mainz.de>
Source record: 12350

Hmmm,
first of all you mean HDI = High Density (disk) interface by Erhard Puetz ?!?
Or do you mean HDI = Hard disk interface ?!? Well, the High density interface works with up to 4 drives (5,25" and/or 3,5"), standard industry drives; alas, the interface had been sold out a long time ago (approx. 1992) and it is not possible to exactly clone the pcb of this interface, because one or more chips are already out of production. So, one has to design a new PCB, which will not be easy... Afaik, less than 50 HDI`s were sold in the early 90s, so it will not be easy finding one. Try www.ebay.de or tell the readers at www.abbuc.de you are willing to pay a high price for it, maybe then you are lucky...

Hard disk interfaces ?!? Well, there are several options. Buy the Black Box from CSS, buy or build the My-IDE by Sijmen Schouten, buy a polish IDE interface from Jerzy, buy or build the SIO2IDE interface, etc. etc. Anyways, good luck ! -Andreas.

Source record: 12351

Thanks for the quick reply,

So there is one question that is lurking in my mind. So please be patient with me on this one as it is from a old memory and I am in the process of setting my system backup again. This is from Steve's previous comment that says,

"
It depends on what you have running on the computer. To you any
type
of files at all from a disk, some type of DOS system will have to be
present
in memory to provide the CIO D: handler.

If you are in BASIC with DOS loaded, you can load/save .BAS
files. If
you are in Action! with DOS loaded you would be loading saving .ACT
files, etc.

"

So you put the DOS DISK in the Drive, It Loads, It brings you the mainScreen (the Screen with the possibilities that if you press one of the possible single keys, it saves, loads etc.)

Can you go to the OS screen (For example if I wanted to to write a Atari Basic file)?

Basically is DOS loaded somewhere in memory and it is called upon when needed by some command i.e.. LOAD "Dx:PROGRAM.BAS" ?

Also what does the CIO stand for in the "CIO D: handler" statement?

Thanks for the help,
Chris

> It also does not work with the Sparta DOS X cart

Well, this is false, it DOES WORK.

The entire Turbo BASIC XL package - that is, the interpreter, the compiler and the runtime library - works with SpartaDOS X without any problems. I have both (SpartaDOS X 4.20 and Turbo BASIC XL 1.5) and they cooperate without any problems.

However, to run Turbo BASIC XL under SpartaDOS X your machine must have at least 128k of RAM (mine has 256). On vanilla, 64k 800XL it won't work for the same reason as with SpartaDOS 3.x.

> Atari Basic file)?

I'm assuming here that you are using an XL or XE computer with
a built in BASIC rom.

When you boot with BASIC enabled (by not holding down OPTION), you
will get a READY prompt, which is BASIC. Then you type DOS to call the
DUP.SYS menu. At the DUP.SYS menu in most Atari style DOSes, you use
the 'B' option to 'RUN CARTRIDGE', that will return to you BASIC.

If you boot up with BASIC disabled by holding OPTION, you will not
be able to enter BASIC by using the 'RUN CARTRIDGE' option, it will complain
that no cartridge is inserted.

> Basically is DOS loaded somewhere in memory and it is called upon when
> needed by some command i.e.. LOAD "Dx:PROGRAM.BAS" ?
>
> Also what does the CIO stand for in the "CIO D: handler" statement?

CIO means Central Input/Output. When you turn on the Atari, there
are a number of built-in CIO handlers installed, including C:, P: and E:.

These are the cassette, printer, and screen 'handlers'. But there is
no D: handler to read and write files to the disk. That is loaded into memory
when DOS.SYS is initialized. After that a 'D:' entry is in the CIO table and
any program can, like basic, can read or write files to a DOS formatted disk
by prefixing the filename with D: or Dx: as in:

LOAD "D1:PROGRAM.BAS"

The "D1:PROGRAM.BAS" is passed to the CIO handler, which passes it to
DOS.SYS, which takes care of loading or saving your file.

You didn't frame your question well enough to give a specific answer.
Someone said if the data is part of a commercial program, say a data base
program, the data will be in an unusable format, except by running the data
base software. I would guess the data in question is word processor data,
which would probably be retrievable even without the original word
processor, with some effort. No, it isn't possible to read a Atari 8-bit
single density disk in a PC, without some special hardware. So, let me ask
the questions.
1. What density are the disks? (probably single)
2. What program was used to make the files?
3. Is this something you want 'in general' for repeated use, or a one-time
event. ie. do you want to be able to do it yourself, or would it be OK to
have someone do it for you?
4. What equipment do you have, or propose to use to accomplish what you
want? Do you have Atari equipment, or just the disks?
A general answer to your question leaves much to be desired because we don't
have enough information to make a specific answer, so you get a lot of
answers.

What is it that you want to know?

Can you transfer Atari 8-bit files to your PC? The answer is: Yes!
Will the Atari 8-bit files work on your PC? The answer is: Maybe!

If you have files on your Atari 8-bit that you would like to transfer to
your PC, there are many ways to do so.

1) You could use your Atari 8-bit and modem to call your PC and upload
the files.

2) You could use a null modem cable between your Atari 8-bit and PC and
upload the files.

3) You could use your Atari 8-bit to upload the files to an online
service and then download the files with your PC.

4) You could use a cable such as an APE or SIO2PC to transfer the files
to your PC.

5) You could just download copies of the files that you want from the
internet and not even bother with doing an Atari to PC transfer.

I am assuming that you are running an Atari emulator on your PC and that
you want software for your Atari emulator. I have described five
methods above. Pick the method that seems most convenient for you and
do it!

Some Atari 8-bit software will NOT run on your PC for various reasons.
I'm not going to get into the myriad reasons here but suffice it to say
that you will find most Atari 8-bit software will run under emulation.

My best suggestion to you is to just download disk images of the Atari software from the internet. I think you'll be quite amazed at what is available as freeware, shareware, or abandonware. These Atari 8-bit disk images are quite abundant on the internet.

Don't expect everything to be handed to you on a silver platter! The people here will help you in any way they can but please remember that these people are Atari enthusiasts. The Atari 8-bit is not their career or their life! If you are not satisfied with the answers that you are getting from the people in this newsgroup, go find your own answers!

I repeat... If the Atari disk is readable (= not damaged), I can get the
files off the Atari disk into a PC. As to whether or not they are usable on
a PC, that depends on what kind of files they are.

I made a longer response, but to respond to the above, I'm sure there are
people here who would make the necessary transfer for you, or your client.
I can't, I won't be at my Atari equipment for a while.

As for the addon board, I might actually have a few of those left if you want to do a trade. I take it you have the eprom image somewhere and are already working on that?

I have the boards in the original stereoform packaging and makeshift documentation that it was sold in years ago. As for the eprom, well not as many.

The guy who made that was here in Dallas.

1111. DGS Atari 8-bit commercial/PD CD - $6 for this weekend only

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-25 11:03:08 UTC
From: dgs@clara.net
Message-ID: <3568e886.0502250303.13860983@posting.google.com>
Source record: 12366

Hello All,

We are repeating our offer on the DGS Commercial/PD CD-ROM again. For this weekened only (from now until the end of the 27th Feb 2005), we are offering the CD for just $6, inlcuding airmail shipping. That's a $4 saving on the usual price. UK buyers can buy it for ï¿½2.00.

As you may have read before, eBay have basically banned us from selling this on eBay for no obvious reason. The only way to get this now is directly from us.

The CD contains our entire PD library (191 mostly double-sided disks), along with the majority of our commercial products, including the QUICK programming language, and SAM GUI from PPP Germany. The CD contains both ATR and DCM format images of the disks, along with user manuals in PDF format. Full details of the contents are on the website.

This offer is only available to readers of this group, and no direct link to the offer page exists on the main site, so please go directly to this page to get the discount:

http://www.dgs.clara.net/cdrom-a8.htm

Payment is by PayPal only. Payment buttons are on the page, or you can pay directly through PayPal if you prefer.

Dean Garraghty

The only hardware needed is a 5.25" drive and a cable to connect it to! The drive might have to be a certain kind, mabye... like the OLD 360k drives or, I think, a 1.2mb will work too? I think the disks have to be in a certain format to work, though?

Come to think of it now, I vaguely remember doing that one time and it worked! I took a disk and formatted it on the Atari and then put a file on the disk and I was able to read it on the PC! I don't think you needed a prog to read the disk on the PC but I don't remember?

This probably is *NOT* the easiest and best method... but it is possible and it does work!

8-bit
> floppies (and it *CAN* be done!) or using some kind of cable between the
> 8-bit and PC, which there are a few ways to do that.

Correction: I don't think a prog is needed to be able to read 8-bit floppies on a PC? Only thing needed is an old-style 5.25 drive (I don't know if any 5.25 will work?) and a cable to connect it up. I haven't really tested this method much, BUT I did do it one time and it worked! I think the disk has to be in 180k format because I think that's the lowest format available on a 5.25 drive? So, if you use this method, you probably will need an 8-bit drive (Rana, etc) that does TRUE double density (180k). None of the Atari drives are suitable using this method because they can't do true double density! So this method probably is *NOT* the best since most disks out there are probably in either 90k or 1050 enhanced density!

So sorry for bringing this solution up and confusing you! I realize now that it's *NOT* a good solution for you or your client! Again, the *BEST* solution, if they have an 8-bit drive you can use, is to use a cable as suggested here... APE or SIO2PC! I recommend the latter because you might need to use a program with APE to read the disks but I don't think you need one using an SIO2PC cable?

Looks like this thread is dead, but I saw it and wanted to see if I could make it clearer for you, Retro!

Sounds like the games you are referring to are games that load from a disk-based format! I seriously doubt you can convert these from sng to dbl density! These kinds of games rely on the disk format which they were made in... most commonly 90k(128b/sector)! These you *CAN'T* convert to dbl because the sectors WON'T be in alignment! If you try to put them into a dbl density, you will end up with 2 128k sectors in 1 256k sector! You think it might still work, but it won't because the game would not be able to find the 2nd sector! Disk based games are based on sector links and they are usually in the sng format (128b/sector). If you did try to convert, it would end up like this....

90k (128b/sector) vs. 180k (256b/sector)
sector 4 sector 4 sector 5
sector 5 sector 6 sector 7
sector 6 sector 8 sector 9
sector 7
sector 8
sector 9

See what I mean yet?

Now if the games were converted to a file format from the disk-based format, then they will work in any density as the person who converted the game has removed the sector links and put it into a file format which can be loaded from any density.

Yes, most disk-based games *ARE* in sng and cannot be converted to dbl. Unfortunately, sector links are not changed if you try and move it from sng to dbl so, as I said above, you will end up with 2 128b in 1 256b sector! If you can convert the sector links, which is tedious, then it might work! Or just remove the links and make it into a file, if you know how? Hence, you need to look for a file format of your game in order to use it in a dbl density image file.

Hope this helps?

I don't know if you are talking about real disks or emulation, but here's my answer...

Are these files in an ATR format or are they EXEs? If they are ATRs, then you *CANNOT* convert it into a dbl density ATR because there are probably sector links and they would be bunched up and the game would not be able to load! It will stop right after the boot sectors (1-3)!

Disk-based games cannot be converted from sng to dbl density because of the sector links that the game looks for as it is loading!

You would need to get these games in an file format (EXE/COM) instead... which you should be able to find them!

Hope this helps?

Source record: 12373

I couldn't remember but thanks for the info!

As far as this person, they need a simple and easy way to get files from Atari 8-bit disks to a PC, so that's why I recommend the SIO2PC instead... assuming the person has an 8-bit drive to use to connect to the PC?

Using the method I previously suggested would be much more tedious and pretty much useless because most of the disks, I am assuming, that the person has are probably in sng (90k) or enhanced (1050) density. Using the method I suggested, the disks would all have to be in 180k density or transferred to 180k density (tedious, if you have ALOT of them!)... don't they?

If the person doesn't have that many disks, then this could be a quick and easy solution! Just need a 360k drive, as you said, and a cable and hook it up and you're set to go! BUT you need an 8-bit drive that is capable of true double density (Rana, etc?) and format a disk on the 8-bit and then move the file to the 180k disk and then put it on the PC to get the file. Is this right?

Except for XF-551 which has spin at 300 rpm. You couldn't read/write standard Atari floppies on it, if the rotation wasn't compensated by a higher frequency oscillator supplying the clock to the WD 1772. The same way, I guess, you can use a drive rotating at 360 rpm.

Hello,

Yes I'm interested in the addon board AND the eprom image. I couldn't find either. I'm sure we do some sort of trade. I have to go shovel snow now because it's winter in New Jersey but let me know what you are looking for in a trade. Thanks a lot.

I don't remember how you do it? Maybe you have to format the disk on the PC
first? Then put it on the 8-bit and put the file on the disk or visa-versa?
I know I did it one time and it worked!

There are some limitations to this method... but it works... somehow!

Does anyone know how to get a hold of someone at this site?

There's a problem. I think it's on their end!

I can't get directory listings. It stops after 38 files and won't get the rest of the directory!

I am using an ftp client... Total Commander and I haven't had this problem in the past.

Does anyone know what might be the problem or how I can get a hold of them to let them know there might be a problem on their server?

Thanks!

Nite Hacker

: > 8-bit and PC, which there are a few ways to do that.
:
: Correction: I don't think a prog is needed to be able to read 8-bit
: floppies on a PC? Only thing needed is an old-style 5.25 drive (I don't
: know if any 5.25 will work?) and a cable to connect it up. I haven't really
: tested this method much, BUT I did do it one time and it worked! I think
: the disk has to be in 180k format because I think that's the lowest format
: available on a 5.25 drive? So, if you use this method, you probably will
: need an 8-bit drive (Rana, etc) that does TRUE double density (180k). None
: of the Atari drives are suitable using this method because they can't do
: true double density! So this method probably is *NOT* the best since most
: disks out there are probably in either 90k or 1050 enhanced density!
:
: So sorry for bringing this solution up and confusing you! I realize now
: that it's *NOT* a good solution for you or your client! Again, the *BEST*
: solution, if they have an 8-bit drive you can use, is to use a cable as
: suggested here... APE or SIO2PC! I recommend the latter because you might
: need to use a program with APE to read the disks but I don't think you need
: one using an SIO2PC cable?

APE "is" the program, SIO2PC is the hardware "cable".

He was a technical write until the 1980's where he quit his job because he
was making more money as a programmer. However, after the software crash of
the early 1980's (1983 or so), he went back to being a technical writer and
hasn't written anything since.

: OK, so you do need APE or another program to use the SIO2PC?

Yes, the PC's controller although it can write and read
160K, 180K disks can't assimilate the same format as the
atari drives. Neither can the OS determine which sector/track
the data is on in it's own drive alone. If you think this
is bad, try an Apple II disk. :o) They're more their own
construction than the Atari disks. Plus they use GCR, Apple's
own writing technique.

: There are other programs that can use the SIO2PC, right?

I'm not sure if Imagic actually reads and writes disks, but
it is an excellent image converter. There are others. I used
to have a blast with this stuff on my 8088 machine running
older DOS's. I'm just now getting back into this, so I will
be available to add to this thread whenever I discover some
programs that I had forgotten about. :o)

: Thanks!

You're welcome.

Hey, Chris;

"Solomon_Man" <solomon_man@yahoo.com> wrote in message
news:1109268418.498704.168740@o13g2000cwo.googlegroups.com...
> Hi all,
> I consider myself a newbie since I have not used my atari's
disk/or
> cassete system for quite some time. I have a few questions
concerning
> when and when not to use DOS.
>
> 1) When do I use DOS?

DOS is just the disk file management system (FMS); you must boot
it whenever you want to load or save files to disk storage
instead of
cassette. Exception: boot disk games do not need it.

> 2) What File Types extensions do I use in DOS (or when the DOS
program
> is Loaded)?

Extensions are just the last 3 characters of disk file names;
conventions exist to eliminate confusion with other users and
your memory. Common types in Dos are SYStem and
COMmand and maybe BINary. The Dos Menu is used to
move, copy, erase and rarely load, save or combine many
different kinds of file.

> 3) What File Types do I use when not in DOS (BAS?)

Typically non Dos types may be SYS, COM, BIN, ASseMbly, Mac65,
OBJect, EXEcutable, TeXT, DATa, ACTion, LIBrary, PICture, FoNT,
ARChive, SouRCe, and any other 3 letters someone devises.

> 4) What File Types are there out there?

Most common are those above plus BASic sometimes called
SAVed and LiSTed Basic for your purposes.

Generally; 2 types: Application and Data. After this the lines
blur..
System files are really a type of application; they are also
executable
binary object files; Basic and Assembly languages are (sometimes
on carts) applications which generate data files which can also
be

application programs in tokenized or text or binary formats.
Beyond
this it can spiral into insanity. Word processors create data
files in
either text or tokenized form with printer layout codes;
spreadsheets
and data bases have various data formats, as well etc. etc.

> 5) What is the difference between the OS (on the Machine 800XL)
> and the DOS on the Disk?

The OS handles the keyboard, display, printer, cassette, sound,
and start of disk boot process; Dos finishes booting FMS and
configures itself to be utilized transparently by the OS in
accessing
disk data as files.

> 6) Some common commands to Load,Save,Delete files on DISK and
CASSETE?

Disk pairs are: SAVE and LOAD "D2:FILENAME.SAV" for tokenized
or LIST and ENTER "D1:SAMEFILE.LST" for text versions of program.
Delete is XIO 33, #7,0,0,"D1:FILENAME.EXT" or use Dos menu. This
btw only marks the space as available rather than removing the
data;
suitable utilities can recover it anytime before it is
overwritten by new files.

Pairs on cassette are CLOAD & CSAVE and SAVE "C:" & LOAD "C:"
for tokenized and LIST "C:" & ENTER "C:" for the text format.
These are
all three slightly different incompatible formats on the tape.
All you can do
is record over top of a file to remove.

> 7) Can #6 (DISK) be done only when the DOS program is loaded?

Yes for disk; cassette is accessable even when Dos not booted.

Ya i had the same problem with SFTP on Win32..

Have you tried looking up their domain for the 'admin' contact info?

You absolutely need software on the PC to read Atari disks.

I already posted this information but perhaps I wasn't clear.

- To copy single density Atari disks to a PC you need a 5.25" drive (360 KB or 1.2 MB will work) and you need a slew of utilities.

The combination that I use is Anadisk (disk dump option), DeAna (converts Anadisk dumps to PCXformer disk images).

Making an Atari disk image this way takes about 15-20 minutes.

Once you have a disk image you can use extraction tools or an Atari emulator to access the individual files. I personally use the emulator, Atari800Win plus. Occasionally I convert the PCXformer images to ATR images and use MakeATR to extract the files (very fast extraction). There are other tools to extract files but these are what I use.

- To copy double density Atari disks I use WriteATR which produces ATR images. Unlike the above process, this is a single step and very fast.

You still need the same kind of utilities to access individual files.

Making a disk image with WriteATR only takes about 50 seconds (for single side, double density disks).

WriteATR can also write/format Atari disks with a 1.2 MB (or 360 K) floppy drive on the PC but it is a bit tricky. You must use new virgin floppies or you must completely blank old floppies. Re-formatting does not work. I use a powerful static magnet to erase old floppies but I undestandr a bulk tape eraser is probably better. The problem with re-using PC disks is that 80 track drives write information that can't be completely erased by the PC drive or the Atari 40-track drives. WriteATR formats and writes simultaneously and only takes about 1 minute complete (again that's for single sided, double density disks).

WriteATR is a new utility for me but I have made several Atari disks from ATR files.

- To read Atari files directly from a double density Atari disk you can use Util.exe (sometimes called DskUtil). There was an older utility, I think it was called Atario (or something like that) but DskUtil was more flexible.

- With an SIO2PC cable I use Nick Kennedy's software, SIO2PC.COM, and also the trial version of APE. I mostly use these applications for their intended purpose, emulating an Atari drive, but I do occasionally make real single density Atari floppies from images on the PC. I don't know another way to do this.

- These are not theoretical solutions. These are the methods I actually use to tranfer data files, programs, and disks (single and double density) between the Atari and the PC.

- I don't deal with copy-protected disks at all so I can't help anyone with that subject.

What you see at the link I provided is all I know about Atari800Win Plus. Sorry.

However, somone posted a link a month or so ago regarding the Atari800Win core software. Open Source development was continuing on Atari800Win, then at rev. 1.3.5 . (Atari800Win Plus 4.0 beta 3 is based on an earlier 1.3.2 core).

Project progress can be followed at www.sourceforge.net.

OK,
I have been following the link and I have a question about the above
two post about ATR files and EXE files.

Is there a converter from ATR to the EXE?

If not how was the ATR file or the EXE file originally created?

What does ATR stand for?

I assume EXE stands for executable but what are the differneces between
a EXE/COM and a ATR file?

Please be patient with me as I am a newbie.

Thanks,
Chris

Uhm...
I think we generated so much noise that the OP (Cagey Bee) has departed.
I'll give Paypal $10 to anyone who can prove they read or wrote a 90k Atari disk on a modern PC, using modern 5.25" drive, 360k or 1.2meg, and not using a special controller. Charles Marslett wrote 'myutil' to read and write Atari dble dens disks, using MyDOS. I played with it quite a bit, even wrote my own PC and Atari programs to transfer files without a null modem. Double density uses a MFM protocol. Single density uses some other protocol that PC controllers don't support. You can use a 1.2 meg 5.25", but it requires telling the controller to use dbl and not high density, you have to use your own machine language routines, like Marslett did.
It is correct that you have to use a virgin dble dens floppy, and it should be formatted in the PC, using a special program like 'myutil', or a totally erased, magnet erased floppy. Most double density 5.25" disks have a hub ring, 1.2meg 5.25" usually don't have the ring. I don't remember, but I think single density 5.25" also have the hub ring. It was/is possible to format a double density 5.25" either double or single. I'm not sure there is such a thing as a single density 5.25" floppy.
But I ramble.

>
> Is there a converter from ATR to the EXE?

An ATR image is a whole disk image, think of it as all the raw
data from a floppy disk, taken without modification, and placed into
a PC file.

An EXE file is a regular Atari file system file that contains
segments of code and data. Typically an ATR file (on your PC) is the
container, and the EXE file is stored INSIDE the ATR file.

The Atari does not understand ATR files, these are raw containers
used by emulators. The Atari will use the contents of the ATR file,
whatever that may be, without actually being aware that its using an
ATR file instead of a real disk.

So its really apples and oranges, you cant convert an ATR image
to an Atari EXE file, the Atari wouldnt understand what it was. You
could convert an EXE to an ATR by making an ATR image that contained
just one EXE file, but thats not really 'converting' so much as it
is creating an ATR and plonking a file into it.

> If not how was the ATR file or the EXE file originally created?

ATR images are created by programs like APE, Atari800, SIO2PC
and other emulators/simulators. The ATR is a PC container for the
raw data stored on an Atari disk.

EXE files are typically created by an Atari assembler or
compiler. The PC does not run the EXE files, your Atari does.

> What does ATR stand for?

Its probably just an abbreviation of 'ATARI'. Check Nick Kennedy's
original SIO2PC documentation, there might be something about its history
there.

Uhm... I'll claim the $10. I did read a single density disk in my PC.
I don't think there is a utility to make it useful, but ANADISK successfully
identified a Atari sngl dens disk in a PC 5.25" drive. Then using DEANA,
I was able to make the dump into something that might be a readable disk
image. OK. So, I'm wrong. There were errors reported, but it did read.
Deana only works on single density disks. So maybe a new answer to the OP's
question is to use ANADISK and DEANA. Then the files may be accessable
using XDIR or IMAGEMAN. Sorry. I think it may be my 'new' computer, has a
floppy controller that understands single density.

Me, again.
I successfully read a single density disk with ANADISK. Converted to a .XFD using DEANA. Converted to an .ATR using IMAGIC, then it booted using Atari800win 3.1. Huh. My old 486 wouldn't read single density disks using ANADISK. Sorry.

TI users use TI99-PC (you can find it under ftp.whtech.com under PC
utils).
This program, in Qbasic with assembly routines, allows you to
read/write TI disks on a PC drive (3.5" or 5.25" HD or LD). It can
read/write TI single-density (FM format) or double-density (MFM
format). On a lot of new PCs, it cannot FORMAT single-density.

Perhaps you can modify the Qbasic code to the Atari or other formats,
or contact the author, Paolo Bagnaresi, for assistance.

LOL! You did that just so you wouldn't have to pay me $10.

Check the program notes for DEANA. I think it was first written in 1994. I know it works on my K6-2, FIC 503+ system which certainly isn't modern, built in 1998. I don't have any 5.25" drives in my newer computer (which isn't all that new anyway).

While I was sorting out problems with my SIO2PC cable, Anadisk and DEANA were the only means I had to port my SD disks over to the PC. I didn't have a lot, perhaps a dozen, but they all copied. Yes I lost a few files due to errors but not whole disks.

One thing I forgot to mention. If you happen to be re-using PC disks and are making single sided disks on the Atari. Anadisk gets confused by the information on side 1 (meaning the second side). Even when you tell Anadisk to scan only side 0 it still finds extraneous data on side 1. The Deana process will then fail.

If the floppies were never used in anything but single sided drive then you should be OK.

This is another case of having to bulk erase the floppy before you start.

I found this out by trial and error. Frustrated when I couldn't port one disk, I blanked another disk as I described, with a magnet, and made a duplicate of the original using the Atari. Anadisk/Deana had no problems with the duplicate.

(Yes, I know I could have just copied the files to a double density disk but I wanted to confirm the process).

You may be right about the 1.2 MB drives but 1.2's are all that I have.

I've made about 2 dozen DD disks and had 3 failures. One turned out to be a bad floppy but the other two had bad tranfers using the 1.2 MB drive. Both disks worked the second time. If you are making disks for someone else using a 1.2 MB drive I'd recommend making multiple copies.

DEANA just reverses the bits in the bytes of a ANA dump.
It would be easy to make a program to work with double density dumps from
ANADISK. To reverse the bits of an 8-bit number, you subtract the number
from 255. eg. 40 decimal would be 255-40=215. ($FF-$28=$D7)
(11111111-00101000=11010111).

I do this all the time using a SIO2PC cable. The data is transfered to a disk image on the other computer which can then be extracted out. Simple. You just need to get the cable and APE.

You should check with your post office, some will accept and even
cash a postal money order if the sender specifically buys an 'international
postal money order'.

I've had people successfully cash these at both the Canadian
and Japanese post offices.

> I consider myself a newbie since I have not used my atari's disk/or
> cassete system for quite some time. I have a few questions concerning
> when and when not to use DOS.
>
> 1) When do I use DOS?

DOS is an acronym for Disk Operating System. You use DOS when you want to use a disk.

You would not need a DOS if your disk has some sort of boot program on it. For example: If you have a disk that has several games or demos on it that boots to a menu.

> 2) What File Types extensions do I use in DOS (or when the DOS program
> is Loaded)?

You can use any File Extension that you want. There are no hard and fast rules for filename extensions.

filename.SYS is usually a DOS system file (eg: DOS.SYS, DUP.SYS, AUTORUN.SYS)

filename.BAS is usually a Basic file.

filename.LST is usually a "Listed" Basic file.

Filename.TXT or filename.DOC is usually a text file.

filename.OBJ or filename.COM or filename.BIN is usually a machine language file of one sort or another.

filename.ARC or filename.ZIP is usually a compressed file.

filename.DCM is usually a compressed disk image file.

filename.PIC is usually a graphic file.

The list is endless.
> 3) What File Types do I use when not in DOS (BAS?)

If you're not using DOS you typically wouldn't be using filenames at all. Filenames are for disk files. To use disk files you need a disk operating system.

> 4) What File Types are there out there?

There are basic files, text files, compressed files, binary files, and
graphic files. Every other type of file is a variant of one of these.
For example: A listed Basic file is actually a text file. i.e. it can
opened and edited in a word processor or text editor.

> 5) What is the difference between the OS (on the Machine 800XL) and the
> DOS on the Disk?

The Operating System on the disk tells the computer what to do and how
to do it. The disk operating system tells the computer how to use disk
drives.

> 6) Some common commands to Load,Save,Delete files on DISK and CASSETE?

To load a basic file from disk, the command is load"d:filename.ext"
To save a basic file to disk, the command is save"d:filename.ext"
To list a basic file to disk, the command is list"d:filename.ext"
To enter a listed basic file, the command is enter"d:filename.ext"

To load a basic file from cassette, the command is CLOAD or load"c:"

You get the idea...

You could also use a short program in basic...

For example, and my memory in this area is a little rusty, you could use
the Open command.

```
10 DIM D$(20)
15 TRAP 90
20 OPEN #1,6,0,"D:*.*"
30 INPUT #1,D$
40 PRINT D$
50 GOTO 30
90 CLOSE #1
95 END
```

This short basic program should produce a directory of an Atari disk.
Again, my memory is a little rusty so line 20 may be incorrect. I think
that it is a "6" for for a disk directory. Just let me check my
reference material.... Yep, that's right!!!

> 7) Can #6 (DISK) be done only when the DOS program is loaded?

I don't know what you mean by #6 being done?
>
> Please do not be afraid to go to technical as I have a Bachelors in

When DOS is loaded, you don't actually see anything. You do not typically see DOS. When you enter the DOS command from your BASIC interpreter, it boots a binary file called DUP.SYS. DUP.SYS or Disk Utilities Package is the user interface for DOS.

Otherwise, DOS is just present within the Basic interpreter. All Disk commands are available from the Basic interpreter when DOS is booted. However, you will not see a DOS menu if you do not specifically request that the DUP.SYS file be booted.

If you have the DUP.SYS file booted and have the DOS menu in front of you, you return to BASIC by selecting the return to cartridge option or something similar.

If you're using MEM.SAV while in the Basic interpreter, the program that you have in memory will be saved to disk and loaded back into memory when you return to basic.

Hi Jochen,

I believe you might have contacted me before on this. Well, found my
Atari 400 at long last with the 1400xl keyboard. (My first Atari 8-bit,
which I would be using now if it used something other than RF signal for
hookup.)

So can show you an example there.

With the Atari 400 you also might try unplugging the 400 keyboard,
taking an eraser to the contacts like you would the leads on a
cartridge, clean the eraser bits away and make sure the contacts are
clean, and then plug the keyboard back in. See if that works.

There is a system in place for them to cash Canadian money orders without
further charge, and there is a system for accepting a similar order from
Sweden (I've done both over the years). Post Offices in the UK can now
exchange foreign currency, but International Money Orders are still the
domain of the banks. Charges for cashing them are ridiculous (15pounds or
more), so small amounts are just not worth doing.

Jochen:

You might also want to try sending me an email; I have an Atari 400
keyboard laying around that I'm not using. I would be more than
willing to give this keyboard to you.

Depending on where you live, it shouldn't cost very much to ship it to
you.

email: managed_resistance@sympatico.ca

If you're interested, you will have to respond prior to March 3, 2005 as
I am switching service providers next week.

I also have an Atari 400 Main Board, 16K RAM Card, and Atari 400 CPU
Card. All of these boards/cards have all of the chips in sockets and
were fully functional the last time they were tested.

They're available free to anybody that wants them. You pay shipping!

I also have an assortment of Apple II motherboards. Again, all of the
chips in these boards are in sockets and these boards were fully
functional the last time they were tested.

I just want to unload them, so they're free to anybody that may be
interested.

I'm also swimming in 16Kb RAM chips. If you want them, they're yours.

I have a bunch of Apple II cards I'm looking to unload as well. I
believe I have an Apple II CPM card, serial card, printer card, and a
couple of RAM expansion cards. One of the RAM expansion cards is the
Apple Language card. The other RAM expansion card is not an Apple
language card.

email: managed_resistance@sympatico.ca

Interested parties should inquire no later than March 2, 2005.

Analog magazine printed the key martix in issue #9 under an
article called
"Build Youur Own 400 Keyboard". It is a tedious yet fairly direct
process
if you can locate a nonwired KB; modern KBs are prewired with
electronics
inside and require circuitry to translate the codes they generate
to data that
the 400 can use. An 800 KB might plug right on to the 20 pin
connector,
if you could find one... another thread here is having little
success locating
just a few keys for one.

Yes there is; it is on the config screen. I will need to locate
the specifics.
IIRC you enter a 5-6 digit code and press a key combination.
There are
also some worm holes like get flower pot level 1 and press shift
something
to zoom to level 4 or some such.

>a special controller.

There are several problems that might make difficult to read Atari disks directly with a PC drive. There are no hard rules on the level of success, it depends on several factors. If you are lucky, your PC might be able to read most Atari disks.

I am talking about hardware issues only. I assume you can talk directly to the hardware, either using plain DOS or a kernel driver under Windows or Linux. So software issues are ignored.

1) Different rotation speed. The Atari drives rotate at 288 RPM, but PC drives rotate at 300 RPM. So the PC controller gets the data at the wrong rate (too fast). Some FDC's can handle this without much trouble. Others tend to produce many read errors. Depending on your PC configuration, there are some tricks that can performed at the FDC that can help solve this. This issue affects all Atari disks.

2) Different density. Most original Atari disks are single density. They use a completely different encoding than double (or high) density disks, usually known as FM (as opposed to MFM). In theory the original PC FDC can handle FM. In practice, the FDC on many PCs can't. A PC normally doesn't need to access FM disks. So FDC manufacturers never care too much about FM support. Some FDCs don't support FM at all (explicitly mentioned in the datasheet). Some support FM but not very reliably, probably because the feature was never tested too much. This issue is, of course, not relevant for non-single density disks (double/medium/enhanced).

Somebody mentioned here he can read/write FM disks, but not format them. This is strange, if the FDC can write FM sectors it can also format a whole track in FM. I suppose this is a problem of the software, and not related to the hardware.

3) Using a 1.2Mb drive. An HD drive usually has no problems reading SD/DD disks. The head is narrower (obviously) than a 40 tracks drive. In theory this might make it less reliable to read marginal disks. But if the disk is ok usually this is not a problem. The problems is when writing/formatting. Again, because the head is narrower it writes only about half of the track width. The rest of the track will keep the previous state/signal. Trying to reformat the 80 tracks will not help.

Whatever signal is on this part of the track creates too much interference when read with an Atari drive (or any 40 tracks drive).

A viable solution is to use virgin unformatted disks. Or otherwise bring old disks to a virgin state. Some people report success using a bulk eraser. But this doesn't actually bring the disk to the original virgin state. Ideally the disk should be degaussed, which is a different type of erasing than the one performed by a bulk eraser.

BTW, a HD PC drive rotates at 360 RPM. But the PC FDC compensates using a higher clock (very similarly as the XF-551 does).

4) Flippy side. This is the most difficult issue to solve. Flippy side is the back disk side written with a SS drive by flipping the disk. Accessing the flippy side using the second head of a double sided drive is not possible without a special controller. This is because the disk rotates in the opposite direction. Using a special controller is not a total solution. The first 3 tracks cannot be accessed and the others can, but not reliably.

Depending on the drive it is possible to access the flippy side exactly the same way as the Atari drive, by flipping the disk. However this won't work with most HD drives. When you flip the disk the drive doesn't detect the index hole anymore. The drive mechanism itself will refuse to operate without the index hole. And it won't deliver any signal to the FDC. Same thing happens with later 360k drives. Earlier ones usually have no problem. Some 360k drives have jumpers to configure if the ready state depends on the index hole detection or not.

Disregarding the drive limitation, the FDC can't format the disk if it doesn't receive the index pulses. So you can't format the flippy side. You can format the flippy side with a special controller though (again, only as long as the drive itself doesn't require the index).

Somebody asked if exists such thing as a single density disk. Yes, there were virgin disks branded as SD. I think I still have a few of them. I don't know for sure if the disk is actually different than a DD one or it was just a marketing issue. I suspect (but I don't know) this was more a results of quality testing. Disks that performed marginally during testing were marketed as single density. Probably not very different than was done with single sided vs. double sided disks.

Somebody mentioned that the utility that reads FM disks "reverse the bits in the bytes". It doesn't. They are actually the Atari drives that perform this negation. This was a bug in the first 810 firmware release. It negated the bytes both when reading and writing to the disk. This was harmless and transparent to the user because it happened in both directions (one compensated the other). Later Atari and third party drives have no choice but to reproduce this behavior for compatibility.

<snip>

That'd be me. It all depends on the PC hardware. Some can
read/write/format single density, others cannot format, others can't
even read it.

TI99-PC contains extensive help docs, including a partial list of
hardware compatibility.

I'm about to put an old 360k 5.25" drive in my PC. I don't use the 3.5"
much. Besides, most of my interesting TI stuff is on 5.25".

Ben

1175. *Real* A8 Laptop?

Newsgroup: comp.sys.atari.8bit
Date: 2005-02-27 02:08:57 UTC
From: LLppwhite@aol.com
Message-ID: <12e3f8fa.0502261808.5c27e77e@posting.google.com>
Source record: 12330

I've been thinking for a bit about trying to construct a *real* A8 laptop. Of course, the emulators do a fine job, but "the real deal" no longer seems outside reality. Obviously, a 130XE main board would have to fit, but with the current "wide format screens" chassis space should exist for an XE main board. Battery life would probably be very limited, but largely this would be a "pluggable" laptop. A laptop HD would work along with a built-in (probably MYIDE) interface. A line-doubler should work fine, and I've seen them with boards as small as around 3 X 4". Probably no built-in floppy, but there are some very compact control boards available now, so an external floppy might be feasible. Using a laptop keyboard could be a real problem, but interfacing through USB keyboard seems plausible now. Regular Atari sound would be produced using a very small AMP with the laptop speakers.

Wouldn't that be a real "mind blower!" Fortunately, I've worked on laptops, and have a pretty good handle on dealing with the compact arrangements in them. Am I forgetting (in concept) any really big element? Maybe I've had too much caffeine today?

From: Nite Hacker <notvalid@yahoo.com>
Message-ID: <BhfUd.129163$0u.4528@fed1read04>
Source record: 12334

Let me clarify what I did one time...

The method I used didn't require any programs on the PC... as I recall! Reason is, I was *NOT* using SD(90k)! I was using a Rana drive, I think(?), and then I formatted it in DD (180k) and put a file on it (a doc file) and then took it to my school and put it on the PC and I think it read the file just fine (since the 360k drive has 180k density)! I am pretty sure that 1050 would not be suitable for this method? But if formatted on the Atari first (using a non-Atari drive because they have the TRUE DD (180k)... I think it does work! NO program/hardware needed, I don't think... just cables to hook a 5.25 drive to your PC? Somebody, PLEASE, tell me that this is possible? Yes, I had some problems probably due to drive alignment issues!

Don't hold me to this because I really can't recall the whole thing because it happened years ago... about 15!!!

Nite Hacker

PS Sorry if I created confusion here! I was just only offering a "quickie" (sort of) solution to their problem! However, it's *NOT* recommended if they have ALOT of info (disks) to transfer over to the PC! In this case, get the SIO2PC instead... as suggested!

Thanks for all the responses.

1.) Yes, Greg. I contacted you, but I got no more responses.
2.) MR. I will consider your offer.
3.) Jess. I will look up the article. I have a dead 800XL, which I
could use for that.

Bye Jochen

A XEGS would have a detachable keyboard, which connector looks like
DB15 (PC analog joystick connectors). So it should be fairly easy to
solve that problem.

In fact I have already almost a portable atari 8bit system.

I have an 130XE (320KB) with built-in CompactFlash card connected to myide. And I have a Nintendo Gameboy Advanced SP. There is a very nice adapter available for this gameboy. With this adapter you can use the TFT screen of the gameboy for viewing a composite or s-video signal! There is also audio-in possible. So when I make a nice wooden box with place for batteries, the gameboy and the 130XE, I have my portable system. I think it will be heavy, but it will do.

There are already 9000mAh "D"-size batteries available. The only part you have to look after is: make sure you get a clean 5V.

Look here for the adapter
http://store.videogamecentral.com/gaadgbaspava.html

I think I will buy such a thing.

The only thing I am not sure of is IF it will work with the atari video output. I once had a TFT television, that did not like the atari video output. I got strange green lines on the screen. That was terrible, and almost unusable. So I wouldn't know if this will have the same problem.

>
> Wouldn't that be a real "mind blower!"

It would! That's something that's pending in the back of my head for
years now. The only true problem I see is a cost effective display
interfacing. I am afraid you don't get proper signal to drive the TFT
out of your 8biter, neither you find anything generic to convert the
available signals. Taking the video or Y/C signals require extra
interface board, which although available - cost about the price of a
good laptop for such project. They are also very panel-specific designed
and the panels they drive are not laptop typical panels... Another
alternative would be to slaughter a LCD tv-set with Y/C inputs, which
also isn't cost-effective as of today yet, and again the tv panel
probably won't easily fit into your laptop's casing...

> Fortunately, I've worked on
> laptops, and have a pretty good handle on dealing with the compact

IMHO the one I described above. If you know an easy solution/workaroung
to it - let us (me) know immediately! ;-)

> Maybe I've had too much caffeine today?

Happens from time to time ;-)

Using Y/C aka s-video should be the goal anyway. Old 800's composite
output was terrible.

BTW. What is the Gameboy's display resolution?

Found it:

Display

Display Type
LCD TFT (Active Matrix)

Screen Size
2.9 in.

Max. Resolution
240 x 160

Which certainly is below the most 8biters' resolutions.

Source record: 12248

You need to go to DOS menu (DOS 2.5 or DOS 3.0, I think? - but wouldn't recommend the later!). I believe there is an option to create the MEM.SAV file. You can't create it from BASIC, I don't think! So go to DOS first by typing DOS<enter> from BASIC and create this file and then go back to BASIC and enter a program and then when you go back to the DOS menu, it will save what you have entered into the MEM.SAV file. Just be sure that if you want to save the program to save it using the regular means... SAVE"D:PROG.BAS" or LIST"D:PROG.BAS" because if you later use the SAME disk with the MEM.SAV file and you enter a different program and go to DOS, it's going to erase whatever is currently in the MEM.SAV file. It's ONLY a temp storage and is *NOT* the method to use to save your programs. It's only meant to be used to store your program temporarily while you go to DOS and when you come back to BASIC, then it re-loads the program from the MEM.SAV... if it exists.

Hope this explains it?

Thanks Jorge. You really cleared things up. I'm sure my original
insistance that PC drives couldn't read FM/single density is because my 486
couldn't. I think also an old AT 640k computer couldn't (using ANADISK). I
extrapolated that if my computers couldn't do it, nobody could. My current
PC computer does fine reading FM disks, I'm not experimenting with writing.
I do remember that you must use either a thoroughly 'degaused' disk, or a
virgin disk to do writing of Atari disks in a PC.
I wrote a program to transfer files A8<>PC, using Charles Marslett's PC
assembler code. I believe it is the only program that will write a double
density MyDOS or SpartaDOS boot disk on a PC. Heh, heh, I might try it
again.

I have an AST 486DX-4 laptop running PCXformer 3.8 under MS-DOS 6.22.

When you boot it up,it:

displays an ATARI fuji .gif
plays a .wav file " Welcome to the wonderful world of Atari!"
goes right to the SpartaDos screen.

All this is done seamlessly,without any hint of MS-DOS.

Admittedly not a *REAL* A8,but it amazes my PC friends!

The XEGS doesn't have a parallel port though. It does have a cartridge port. Does the MyIDE interface connect to the cartridge port?

Speaking of XEGS motherboards, I have one laying around that I'm not using. If anybody is interested in it, I can be reached at the following email address: managed_resistance@sympatico.ca

Wow! I haven't actively used my Atari 8-bit in ages. If memory
serves, you do not actually use MEM.SAV. DOS uses MEM.SAV.

If you have a Basic program in memory and enter the DOS command, the
disk utilities package is loaded into memory. If I remember correctly,
the basic file in memory is stored to MEM.SAV and reloaded into memory
when you exit DUP.SYS.

It's been a long time. A lot of this stuff I'd have to look up
again... And most of the latest developments in the Atari 8-bit world,
I'm not familiar with at all.

I have a non-working Atari 800XL that appears to have been heavily modifyed at one point. However, alot of the modifications have been removed.

There were two toggle switches protruding through the back side of the 800XL case. One of these switches was wired to the OS chip which had another socket (empty) soldered on top. The second toggle switch was connected to the chip at U28 (74LS375N). There is another chip soldered to the top of this IC but the markings are not clearly readable.

Does anybody have any idea as to what this second mod may have been?

I'm guessing that the OS IC mod was a dual OS mod that was toggle switchable. But the mod on U28 has me baffled.

Like I said, alot of the mod components had been removed when I received this particular XL.

Any ideas appreciated.

I was thinking about really getting into the 8-bit scene again. I was wondering what kind of stuff you folks are doing with your 8-bits?

I doubt that too many people would still be using their 8-bits for any serious work anymore. So, aside from games, what other kind of stuff are folks doing with the 8-bit Atari these days?

I know that mod'ing the 8-bit can be alot of fun but what kinds of things are you doing with your turbocharged 8-bits?

I found an old CSS catalog (from 1993) which had alot of interesting products in it. The blackbox, floppy board, multiplexer, etc. Is anybody still producing these products?

I've always wanted to get my hands on a 1MB MIO from ICD. I've heard that the Black Box is a better interface, but there was something about that little 1MB MIO that I always found kind of cool.

Is Fine Tooned Engineering still playing around with 8-bit products? I know that they were doing something with some of the old ICD products a while back.

Actually, I enjoy writing (word processing) my 130XE. I do a lot of
journaling with it with AtariWriter 80. I use a small Apple green-
screen monitor. It's very easy on the eyes.

My 130XE is "stock", but I use an SIO2PC cable connected to my
1040STe and 800XL DeeJay software to emulate drives. I also use a
Lantronix UDS-10 (modem emulation to ethernet connection) to connect
to some great Atari BBSs.

All that to say I use the computer more for applications than gaming,
and it is still very usefull.

Can't locate the code for the game adjustment screen, but
here are some worm holes:

Lvl #1: collect flower pot near top center, press "1" plus Start
while immunity lasts and arrive in Lvl #4.

Lvl #2: collect paint roller and press "3" plus Start for Lvl 22

Lvl #3: collect chalice and press "4" plus Start for Lvl 15

Lvl #5: collect teapot and press "8" plus Start for Lvl 8

Lvl #10: collect trident and press "5" plus Start for Lvl 14

Lvl #16: direct airflow in suction tubes one (1) and three (3) to
the
left and collect pie dish and press "9" plus Start for Lvl 19

Those are all I know and have only verified the 1st few.
Jess

I used to use a word processor called Cut & Paste. I fell in love with the interesting menu that it had for accessing your saved files. I remember that I would type all sorts of things into that word processor just trying to fill up the menu and disk with text files.

Cut & Paste was the second commercial software product I ever purchased for the Atari 8-bit. The first was the submarine patrol game, Silent Service. Silent Service was on a Commodore/Atari flippy disk. I remember, as an avid Atari enthusiast, always being offended by the fact that the Atari version was always on the backside of the disk.

I know that I picked up a copy of Atariwriter and later, Atariwriter Plus as well as a few others that I don't recall at the moment. By far, my favourite word processor for the Atari was a public domain product that displayed 80 columns on screen using software tricks and a modified character set. It was a real pain reading things on the black & white television that I was using, but I was addicted to that little Atari 800XL.

I must have at least 300 5.25" disks laying around with Atari 8-bit software on them. I can just imagine all of the interesting stuff that has been produced for the Atari 8-bit since I stopped collecting software for it.

Ah, nostalgia...

I meant the original 800; not at all confident the 800XL uses
the same KB matrix. The XL connector is definetly different...
The 800 KB has a conventional ribbon cable similar to floppy
cables that plug onto pins in recent PCs; the XL KB has a flat
clear substrate with traces painted on it to plug into a thin
edge
card type connector. Sorry :-(

Well, this is the ï¿½ber-mod of all that I've ever come across, but it's
come about because I've been playing around with FPGA's for the last 6
months or so, mainly because they're pretty darn cool :-)

It struck me that (on a modern FPGA) I could design something that would
interface with the XL/XE bus-interface port, and effectively provide an
'upgrade' for the ole 8-bit :-)

The idea is to provide ethernet, IDE hard-disk, and VGA output as a
minimum. To do this, I'll implement a 'soft' CPU core in the FPGA as
well as the support logic for an ethernet chip. IDE I'll do in s/w once
the pins are wired up to the FPGA. For the VGA output I think I can get
away with a resistor-DAC (ie: 3 resistors (= 8 values) of different
resistance for each of R,G and B) for a 640x480x256 colours, with maybe
increasing resolution and decreasing colours up to 1280x1024 in mono).
It'll need some RAM as well, and I think I'll go for SDRAM - mainly
because it's so cheap.

To support the original graphics modes, I'm planning on using an SAA7114
video digitiser chip from Phillips, which will relay the XL/XE video
output through the VGA logic and onto the VGA screen. It'll do that as
the default behaviour, so there'll be no impact on anything, and as a

bare minimum, you ought to be able to use an el-cheapo VGA monitor for output.

Total parts cost in quantity-1 pricing will be a shade under $100, although I'll have to get a board made, and there'll be other bits and pieces. I'm aiming for under $200 for my first prototype though. The board is expensive to manufacture because it'll need 4 signal layers due to the FPGA.

Once that's all designed and built, I'll have a fair amount of s/w to write. I'm planning on using 'C' as the main language, and providing a Spartados-like (well, actually linux-like :-) DOS interface. If I implement E: and S: drivers on the XL/XE side of the link, I ought to be able to transparently support any well-behaved programs in higher resolutions. Anything else will be stuck with native 8bit resolutions. I'll have to write a D: driver though, and an N: driver (Network) would be nice - all PC SMB shares just appearing as N:<machine>/<share>/... :-)

The 'coprocessor' in this setup will be significantly more powerful than the 6502 in the host machine (I'm aiming for a ~70MHz, 32bit CPU), so it'd be rather cool to use that as the main processor when not running games. A program running in BASIC on the new processor would probably out-perform one in machine code on the 6502 :-) First order of business will be to provide a command-shell (like unix and DOS), then a C compiler hosted on the machine itself, then I could even port a BASIC language if I wanted it to look just like an old 8-bit :-) Given how much more powerful than a normal 8-bitter this combo will be though, it might be more applicable to have an ST-like GUI interface...

There's a lot to do here, so you'll probably not hear much for a few months or so, but I'll set up a website and keep y'all informed as to how I'm doing. The day-job comes first, of course :-)

Simon.

As I've said before, Matthias Reichl's WriteATR can read, write, and format DD disks very well using a PC. It's very fast. Formats and simultaneously writes a single sided, double density disk in about 60 seconds. I've made both MyDOS boot disks and BWDOS boot disks (I can't use SpartaDOS on my 800) with WriteATR.

I don't have the tools to fully degauss a disk but I've had good luck blanking disks with a powerful static magnet.

Link for WriteATR

Well, yes, I expected that it wouldn't be "plug'n'play", but remember
Greg Goodwin talking about ROM modifications such thing, so I guess it
should be feasible to overcome the electrical part and the logical
one.
Where are the Analog magazines located? I would like to look that up.

Just for the record. The maximum speed for formatting and writing a whole 5.25 single sided 40 tracks disk (any one, not just Atari) in a PC is about 7 seconds. You need several things to achieve this speed though.

In first place you must skip verification, which is normally not recommended. Otherwise increase time about twice.

A HD drive, otherwise increase time 20%.

A custom controller. You need a custom controller to be able to format and write in a single operation. And also for formatting without "waiting" for the index. Otherwise increase time two/three times.

>I don't have the tools to fully degauss a disk but I've had good luck
>blanking disks with a powerful static magnet.

Note again that this only needed when using a HD drive. You don't need any "erasing/degaussing" when using a 360k drive. Not too hard to find a 360k drive on Ebay. Any XF-551 mechanism is a good PC 360k drive as well.

Wow! That would really put life back into the old 8-bit! Especially with the 70MHz 32-bit processor. You could effectively use an external processor to handle all of the computational heavy lifting and just feed the results back to the 6502 which would basically just act as a traffic cop.

You could really turn the old 8-bit into a graphics powerhouse of sorts. If the 8-bit could drive a monitor capable of 640x480 and had an external processor to do much of the rendering, you'd have a really wild Atari to play with.

I just have one question: What's an FPGA?

The idea started off by me seeing a post in this newsgroup about ethernet on the 8-bit line. The idea that popped immediately into my mind was to use a rabbit semiconductor part (say a 3200 series board) which has ethernet and a general purpose bus (which I could integrate with the cartridge port). Then I started thinking about an FPGA solution instead, with a 'soft' CPU instead of a dedicated CPU chip. That way I could add VGA and IDE etc. etc. The more I thought about it, the more obvious it became...

To start off with (ie: to get something up and running faster) I'll probably just use the XE as a 'dumb' terminal onto the board - ie: it'll just either be fully in control and passing its composite output through to the digitiser and onto the VGA logic, *or* it's a keyboard/joystick input device and everything interesting will be happening on the board itself. Once I've got it working in that mode, I can start to actually make it manage the co-processor environment better.

In fact, the new CPU will only take about ~20% of the FPGA I'm looking at using, and the VGA / IDE / Network controller may not take another 60% between them. It *might* be possible to have 2 of the 32-bit processors on the FPGA. To manage that automatically (ie: have a symmetric multiprocessing operating system) is a biiig job though. I'd have to think that one through a bit more :-)

> I just have one question: What's an FPGA?

It's a 'Field Programmable Gate Array', or a chip that can be reprogrammed after its manufacture to be any logic you like. It's actually not hard - at least I don't think so. They used to be expensive and slow (and I guess relative to current CPU's they're still slow, at <100MHz for anything in my budget, compared to an Athlon at 2.2GHz...)

The FPGA I'm designing for is a Xilinx XC3S400 chip with ~8000 logic cells available for programming to anything I want. It costs about $25 in quantity-1 pricing. The next step up would be a ~17,280 logic-cell part, at $47. The problem with going for the larger one is that it has to be professionally bonded to the circuit board (= more expense). It's a ball-grid-array package which hobbyists like me can't hope to mount properly :-(To give some perspective, the CPU will be ~1500 logic cells...

I may end up being forced to go for the ball-grid-array packaging because the number of i/o pins on the smaller package is limited (141 max). Peripherals eat signal pins... If so, I might go for the larger device anyway, just for flexibility. Imagine a 4-way 32-bit multiprocessor system, all being controlled from a 130 XE :-)

ATB,
Simon.

Hi All-

This is a "composite answer" to several of the posts. Thanks to one and all for contributing ideas, etc. Keep those "cards and letters" coming -- I do appreciate the ideas, cautions, etc.

I had not considered putting together a "from-scratch" portable system, but that might well be less expensive and certainly would be more flexible. I spent a little time last night looking at aluminum and hard plastic laptop/brief cases and the like, and there is a wide variety available. The room available for batteries, etc. certainly becomes more flexible. It certainly would be heavy, but even a 6-volt gel battery becomes a possibility.

My original idea was to build a "sleeper" i.e. It would look just like a regular laptop, but it would be "gutted" and the A8 would be lurking inside. It would probably need to be one of the larger, thicker laptops from the mid-90's to have enough room. It would not be cheap -- but with parts I have laying around, perhaps not a real "budget wrecker." My current plan is to look for an older laptop on ebay and/or at the Dayton Hamfest this Spring. Of course, this project certainly has the potential to become "vapor" -- I may reach a stumbling block that I just can't overcome.

As far as the driving the LCD screen goes, several of the "video to VGA" converters are stand-alone -- they don't require a PC to operate. I have several converters laying around to try out. And yes, many of the newer display devices will not display an Atari composite/S-video signal, so that does loom as a potential problem. I would like a 14 or 15" screen, so that means a full-sized LCD.

I still see the keyboard as the biggest interfacing problem. But that becomes a non-problem if I do the "from-scratch" route -- I would just use the 130XE keyboard, perhaps sectioning the 130XE upper shell just below the function keys to make the surface flat instead of sloping.

I'm going to start laying out the parts and pieces on my work bench this week, and see how things start going together. This does sound like fun!

-Larry

Yet the laptop displays don't have VGA inputs. At least I haven't seen one. Maybe some very, very old ones. Then the displays were really crappy in those. Hence, again you would have to slaughter a LCD monitor and try to fit the panel inside the laptop's casing - similarly to LCD TV-set. Might be possible though.

Good luck and keep us informed on the proceedings!

7 Seconds! That's fast.

However, I never even considered turning off verification and probably
wouldn't

60 Seconds is plenty fast for me. Much faster than creating disks with
the Atari using an SIO2PC connection. However, this time savings is
irrelevent in my case. Though I have had good luck creating disks
using WriteATR, I don't trust disks created with 80 track drives. I
usually duplicate such disks using the Atari's drives. This means the
total time is takes longer than just using SIO2PC.

I've been thinking about getting a few 360K drives. One for PC and two would be nice on my ATR8000.

1235. FA: Various items on eBay

Newsgroup: comp.sys.atari.8bit
Date: 2005-03-01 03:56:25 UTC
From: Bob Stinson <bstin@NOSPAMshaw.ca>
Message-ID: <JJRUd.530468$8l.385339@pd7tw1no>
Source record: 12290

I've got a few Atari 8-Bit items up for auction on eBay, and thought
that some of the folks that read this newsgroup just might be
interested. Items currently available are as follows:

1.) A pack of 9 games, on floppy disk, with less than 2 days left.
Current bid: $3.00 US

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=82631&item=5169032528

2.) An ICD "Printer Connection" cable, with less than 2 days left.
Currently no bids.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=82631&item=5169040812

3.) A pack of 6 cartridge games, with less than 2 days left. Current
bid: $4.00 US.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=82631&item=5169047526

4.) A SpartaDOS X cartridge with less than 2 days left. Current bid -
$67.00 US

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=82631&item=5169053077

5.) A XF551 c/w XF551 Enhancer & a stack of disks, with less than 2 days
left. Current bid: $41.55 US

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=82631&item=5169070999

6.) A couple of books about 8-Bit BASIC programming, with less than 4
days left. Current bid: $8.50 US

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=82631&item=5169906494

7.) An upgrade pack for XL/XE computers(memory, OS, and monitor cables),
with less than 6 days left. Current bid: $51.00 US

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=82631&item=5170553028

1237. Actual cartridge rom files

Newsgroup: comp.sys.atari.8bit
Date: 2005-03-01 05:02:11 UTC
From: Bill Garber <willy46pa@comcast.net>
Message-ID: <opSdndybIN7Lar7fRVn-iA@comcast.com>
Source record: 12292

I am interested in where I can get actual
rom files that I can burn to eprom and then
insert into cards that I've ordered from
AtariAge. I'm getting so I can install a
ZIF sicket into them and we can just put
the chip in the ZIF and then plug it into
the slot. Any links or actual files you
can provide would be appreciated.

Thanks in advance,

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Source record: 12295

Well,
I have been dreaming about this for many years now. As LCD`s are getting cheaper and cheaper and we only need a LCD that can display 320x240 pixels, that should be easy to realize... Alas, I have not found the perfect harddisk interface for me yet. I want a harddisk interface that can work with disk/dos-files (like Black Box, MSC-IDE, KMK-IDE, My-IDE and others) as well as with images (like ATR, XFD or My-IDE images), so I can transfer files as well as bootdisks to a harddisk. Next the harddisk interface should support 16bit and CD or DVD ROM (this excludes the My-IDE!) and it should work via Parallel Bus (as fast as possible with my 800XL Atari; this also excludes the My-IDE!). Last not least it should support some kind of flash cards (compact flash or something similar).

I guess my 800XL has enough space for a) a RAM/Ramdisk extension b) a harddisk interface and c) the harddisk itself. The power supplies would have to stay outside then, as well as the LCD that should fit in size with the keyboard...

On the other hand I am thinking about a desktop based Atari, like the Atari Mega ST(E) series and/or the Megafile harddisks. A friend of mine still has some of these mega ST(E) desktop cases left and they have enough space for a) the harddisk interface, b) the harddisk, c) the CD or DVD ROM drive and d) the power supply. Only the computer itself and the LCD would have to stay out then - and er well, the Mega desktop cases use the grey Atari color, whereas my 800XLs have the brown and beige (chocolate and cream) color. But maybe I will buy another XE, if that dream can come true... -Andreas.

Pretty much any binary file can be burned to EPROM (at least on the Atari),
just have to know where the starting vectors are for the cartridges (sorry
don't have Mapping the Atari in front of me but I think it might be located
at http://www.atarimagazines.com)

Are you doing this from the PC side or from the Atari side?

: Are you doing this from the PC side or from the Atari side?

Yes, I know, but the problem lies in that I can't find anything
that's readable in the way of ATR files. Mostly boot disks that
have no DOS reference. I have tried viewing many ATR images and
none of the DOSes I have can read any files on them. I get either
a 143 or 160 error. I'm assuming these are the same error but from
a different DOS, meaning there is no file structure on them.

If I could just find one ATR that I can view with DOS, just so
I know it can be done, then I might be able to put some of these
games onto eprom. I have the SIO2PC and 3 SIO cables coming so
I'll be able to get these to the real Atari800XL. Will be fun to
use the old machine again. Haven't touched it in many years.

Actually it's not the same one, I got this one from eBay. :o)

I am doing this on the PC. It's where my eprom programmer is
located. :o)

I'm not sure if this would be of some help or would present more
problems but here is a link to build (or buy) a PS2 keyboard interface
for 800XL or 130XE.

http://members.aol.com/MacFalkner/atari/aki/index_e.htm

I don't know what kind of native keyboard encoders are used by laptops
but perhaps the adapter is worth some consideration for your project.
There must be some place to get small PS2 keyboards, assuming the
laptop keyboard is too difficult to adapt.

Marius and all,
Is there a master list of BBS around that I can access via the
internet?

I would love to hook my Atari to my PC and the PC to the internet and
then connect to a BBS and possibly become a online atari BBS.

I have read on a few other peoples posts about this topic. How hard is
this to Accomplish? How $$ as well?

I enjoyed my visit yesterday to your BBS and it brings back a lot of
memories.

Thanks,
Chris

I've been seriously considering getting into that, but right now, it's just
so much easier to pop in an Action! cart and start coding. I really SHOULD
look into CC65, though... I do C programming day in and day out, and I may
as well do some of it for my Atari, too! ;)

1250. MyPicoDos 4.03 released

Newsgroup: comp.sys.atari.8bit
Date: 2005-03-01 19:39:31 UTC
From: Matthias Reichl <usenet-200503@hias.horus.com>
Message-ID: <slrnd29h7j.338.usenet-200503@camel.hias.horus.com>
Source record: 12155

Version 4.03 of MyPicoDos is now available on my homepage

http://www.horus.com/~hias/atari/

MyPicoDos is a "gamedos" which supports loading BAS/BIN/COM/EXE files,
Dos 2.x/MyDOS disks with 720-65535 sectors in SD and DD and MyDOS
subdirectories.

New features in this version are:
- files and directories can now be selected using a joystick in
port 1 or 2
- fixed the initializer program so that MyPicoDos works with
the KMK/JZ IDE interface

so long,

Hias

Seemed even sillier that LOAD "C:" cannot retrieve a file that
was CSAVEd to tape; something to do with inter-record gaps.

Man, I can't believe how much that SDX cart is going for on Ebay. I have one that I hardly use and i'm thinking maybe I should sell it? What do you guys think? Is it something worth holding on to?

Thomas

Hi, I've been wanting to buy one for a while, but every time one goes up for sale on eBay it goes for over $100US. I wonder if it would be legal and/or practical for someone to replicate SpartaDOS X cartridges? If someone could they could easily sell them for $50 each. (I'm guessing, just from what I've seen on eBay)

Well, this is for my co-processor project (see earlier 'Cool stuff'
post). One option is for the co-pro to integrate to the 8bit via that
port, and have the FPGA sample and respond to the address/data lines
coming out of the 8bit.

I'm going to want to install handlers for devices on the 8bit at boot
time, and it would be nice to do that automatically (ie: make the
cartridge bootable) when I switch on the XL/XE.

So, anything you have, I want [grin]

ATB,
Simon.

1257. Make easy money!! NO SCAM!! Please Read!

Newsgroup: comp.sys.atari.8bit
Date: 2005-03-01 23:42:22 UTC
From: sulliman24@gmail.com
Message-ID: <1109720542.731561.265510@f14g2000cwb.googlegroups.com>
Source record: 12162

NEED QUICK EASY CASH???
Turn $6.00 into $60,000...read this to find out how!!!
READING THIS COULD CHANGE YOUR LIFE!!!
I found this on a bulletin board like this one and decided to try it. A little while back, I was
browsing through a newsgroup, just like you are now, and came across an article similar to this
that said you could make thousands of dollars within weeks with only an initial investment of
$6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I
kept reading. Anyway, it said that you need to send $1.00 to each of the 6 names and address
stated in the article. You then place your own name and address in the bottom of the list at #6,
and post the article in at least 200 newsgroups. (There are thousands)
No catch, that was it. So
after thinking it over, and talking to a few people first, I thought about trying it. I figured "what
have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00 (I use the
word "measly" because $6 really is measly compared to the money I have made through the
initial investment). Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I
was shocked! I figured it would end soon, but the money just kept coming in.
In my first week, I made about $25.00. By the end of the second week I had made a total of over
$1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now my fourth
week and I have made just over $42,000.00 and it's still coming in rapidly. It's certainly worth
$6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works
and most importantly, why it works.... Also, make sure you print a copy of this article NOW, so
you can get the information off of it as you need it. I promise you that if you follow the directions
exactly, that you will start making more money than you thought possible by doing something so
easy!
Suggestion: Read this entire message carefully! (print it out or download it.)

Follow the simple directions and watch the money come in! It's easy. It's legal. And, your
investment is only $6.00 (Plus postage)
IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk -
it really works!!!! If all of the following instructions are adhered to, you will receive
extraordinary dividends.
PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours
in 20 to 60 days. This program remains successful because of the honesty and integrity of the
participants. Please continue it's success by carefully adhering to the instructions. You will now
become part of the Mail Order business. In this business your product is not solid and tangible,
it's a service. You are in the business of developing Mailing Lists. Many large corporations are
happy to pay big bucks for quality lists. However, the money made from the mailing lists is
secondary to the income which is made from people like you and me asking to be included in that
list.
Here are the 4 easy steps to success:
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper
"PLEASE PUT ME ON YOUR MAILING LIST."
Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will
not be seen through the envelope (to prevent thievery).
Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed
envelopes, each with a piece of paper stating the phrase "PLEASE PUT ME ON YOUR
MAILING LIST.", your name and address, and a $1.00 bill. What you are doing is creating a
service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are
paying for it!
Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I
checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed
legal! Mail the 6 envelopes to the following addresses:

#1) Damon Bailey
1055 Brookfield Dr.
Medina, OH 44256

#2) Krysta Johnson
9821 Camino Villa #1024

San Antonio, TX 78254

#3) Daniel Torres
2727 W. Oak Ridge Rd.
Bld:8 Apt:3
Orlando Fl. 32809

#4) A.Strachan
P.O.Box CR-56992
Nassau, Bahamas

#5) Kim Pepin
1056 Centennial Cres.
Corbeil , Ontario, Canada
P0H 1K0

#6) Michael Sullivan
155 Parrott Rd.
West Nyack, NY, 10994

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6
becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.
STEP 3: Change anything you need to, but try to keep this article as close to original as possible.
Now, post your amended article to at least 200 newsgroups. (I think there are close to 32,000+)
All you need is 200, but remember, the more you post, the more money you make!
This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal
lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use
it again, and again.
PLEASE REMEMBER that this program remains successful because of the honesty and
integrity
of the participants and by their carefully adhering to the directions. Look at it this way. If you are
of integrity, the program will continue and the money that so many others have received will
come your way.
NOTE: You may want to retain every name and address sent to you, either on a computer or hard
copy and keep the notes people send you. This VERIFIES that you are truly providing a service.
(Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)
So, as each post is downloaded and the directions carefully followed, six members will be
reimbursed for their participation as a List Developer with one dollar

each. Your name will move
up the list geometrically so that when your name reaches the #1
position you will be receiving
thousands of dollars in CASH!!! What an opportunity for only $6.00
($1.00 for each of the first
six people listed above)
Send it now, add your own name to the list and you're in business!
---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS----------
Step 1) You do not need to re-type this entire letter to do your own
posting. Simply put your
cursor at the beginning of this letter and drag your cursor to the
bottom of this document, and
select 'copy' from the edit menu. This will copy the entire letter into
the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of
the blank page. From the
'edit' menu select 'paste'. This will paste a copy of the letter into
notepad so that you can add your
name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do
your postings in different
settings, you'll always have this file to go back to.
Step 4) Use Netscape or Internet explorer and try searching for various
newsgroups (on-line
forums, message boards, chat sites, discussions, etc.)
Step 5) Visit these message boards and post this article as a new
message by highlighting the text
of this letter and selecting paste from the edit menu. Fill in the
Subject, this will be the header
that everyone sees as they scroll through the list of postings in a
particular group, click the post
message button. You're done with your first one!
Congratulations...THAT'S IT!
All you have to do is jump to different newsgroups and post away, after
you get the hang of it, it
will take about 30 seconds for each newsgroup!
**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE
MONEY YOU
WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**
That's it! You will begin receiving money from around the world within
days! You may
eventually want to rent a P.O.Box due to the large amount of mail you
will receive. If you wish to
stay anonymous, you can invent a name to use, as long as the postman
will deliver it.
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a
very low example). So
then I made $5.00 with my name at #6 on the letter. Now, each of the 5

persons who just sent me
$1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond
to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM
posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now,
those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive
5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625
persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies,
that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200
newsgroups with my name at #1 and if still ONLY 5 persons per 200 newsgroups react I will
receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is
no longer on the list, you just take the latest posting in the newsgroups, and send out another
$6.00 to names on the list, putting your name at number 6 again. And start posting again.
The thing to remember is do you realize that thousands of people all over the world are joining
the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford
$6.00 and see if it really works?? I think so... People have said, "what if the plan is played out
and no one sends you the money? So what! What are the chances of that happening when there
are tons of new honest users and new honest people who are joining the internet and newsgroups
everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day,
with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY
and this will really work!!!
Please keep this going!!! It's incredible... We can all help eachother with some of our
financial problems!!! Thanks and have yourself a great day!

A good example of handlers being loaded at boot time would be the Telelink 1
cart. It loads the 850 handler on power up, maybe a disassemble of that cart
might help.

I believe the A8 OS automatically looks for the 850 and loads the R: handler
on DOS bootup.
Or maybe it is DOS that does it. Anyway, I think a term program doesn't
need to load the R: handler from an 850. From other R: devices (PRC, MIO,
BB) is when you have to load the handler. I'm not sure.

Yep, that's right. (Assuming my memory is correct. It's been a looooooong time since I used a cassette on an 8-bit) I believe CSAVE used shorter gaps to reduce program load time. That's something anybody who's waited for a large BASIC program to load from a tape can appreciate!

I don't know what makes the call, but IIRC Dos is not necessary;
the 850
supposedly boots when no drive is present.

I run the BF2k+ on the a800win emulator on an old PC I had around the house.
= $0.00 dollars. This can be done VERY cheaply if you already have an old
PC. Mine is a Pentium 1 running Windows 98.

That way I have the Atari 8-bit BBS online, without sacrificing my precious
8-bit equipment to the 24/7 wear and tear.

If you want to use your 8-bit hardware you can do 1 of several things:

1. Get an old PC and run APE with an APE cable or SIO2PC cable.
2. Hook the 8bit directly to the internet with one of the Lantronix devices.
3. There's a C64 telnet server program written in VB than can be modified to
work with an 8bit - you need an old PC to run the server on.

There are probably other ways that I don't know about to do this.

Anyway when you logoff of my BBS, you will see a list of all the current
Atari 8bit BBSes that I know of... but you have to logon first -
---> telnet://bfbbs.no-ip.com or telnet://bfbbs.dtdns.net

The BBS list (along with other 8-bit related stuff) is also available on my
BF2K+ website: www.amfband.com/bf/

You might not want to look at C code at home then, after looking at it all
day at work. :)

Personally, I like it, since I never learned ACTION, but have doing hobby C
programming for years. It's actually pretty good at optmizing the
resulting code too, but you can always hand code any parts that need it.

>a 143 or 160 error. I'm assuming these are the same error but from
>a different DOS, meaning there is no file structure on them.

There's a disconnect here, since ATR files are DISK images, not cartridge
images. You cannot burn them to a cartridge and have them work without
some other code (usually patches to the OS SIO routines to redirect sector
reads to cartridge-at least this is how the flash cartridges do it... see
http://www.atarimax.com/)

Are you trying to do something like this, or just want to burn a plain-jane
cartridge file?

A cartridge file is usually .CAR or .BIN, or even sometimes .ROM on the
'net.

>guessing, just from what I've seen on eBay)

Well, you can buy a flash cartridge from http://www.atarimax.com and put an
image of SpartaDOS X on it yourself. You only lose the pass-though
capability and it seems the ability to go to built in basic on the XL/XE.
Otherwise, it is the same.

As to legal, well it's up to you what you put on your flash cartridge.
From what I've heard on here about FTe, I doubt he will be popping up to
file a suit. :)

>convert a Flight Simulator II cartridge to files?

Yeah, there were programs that would make a file out of a cartridge. With the older 8k or 16k cartridges it was easier, since there was no bank switching. There still may have been copy protection checks in the games code though: basically attempts to write the cartridge space, which is read-only when a cartridge is inserted, RAM when one isn't (like when you run your disk file version.)

As for newer titles, they are much harder to make a file out of since they do quite a bit of bank switching, not to mention copy protection checks that you need to track down. The good news is most of these games either had disk versions that were cracked, or someone actually spent the time to do a conversion to disk format.

Flight Simulator II, IIRC, can be found in a disk version.

1269. Simulating a boot, MyIDE Images

Newsgroup: comp.sys.atari.8bit
Date: 2005-03-02 05:40:19 UTC
From: Shawn Jefferson <shawnjefferson@shaw.caREMOVEPLS>
Message-ID: <lsja21h5d61jbj5ct4vlut8spa1kgiksn1@4ax.com>
Source record: 12174

Hi,

I need some help with the Atari OS. Specifically, fooling the OS into thinking we are doing a boot from floppy.

You may be aware that the MyIDE project includes a replacement OS, that has an Image Boot routine in place of the cassette routines. Holding down START during a cold or warm start enters this routine. You can select an image to boot with the joystick and press the fire button to boot it.

I wrote a program that does a very similiar job, but allows the user to assign a description to each image slot. It works very nicely, but there is just one small problem:

Not everything that will boot from Mr.Atari's MyIDE Image Boot routine will boot from my program. Since I am doing the same thing within my routine that Mr.Atari is within his, I think it comes down to the state the computer is in during his program (after a cold or warm start) versus the state the computer is in when my program is run (from a DOS, MyDOS or SpartaDOS 3.3a for instance.)

Does anyone have any suggestions on what I should be resetting, or clearing before attempting a boot?

To do the boot Mr.Atari is doing:

```
jsr $C598
jmp $C413
```

Building carts for the Atari is not too complicated.

First the hardware part:

The cartridge must tie pin RD5 to +5V to signal that a
cartridge is present in the area $a000-$bfff. This pin is also
connected to TRIG3. TRIG3 is shadowed at GINTLK ($03fa) and during
the VBI TRIG3 is compared to GINTLK. If the values don't match,
the Atari OS enters an endless loop.

If you are building a cart that can be switched off, RD5 must
reflect the current state (i.e. cart present or not). Prior to
disabling (or re-enabling) a cart, you should disable interrrupts,
the en/dis-able the cart, copy the value from TRIG3 to GINTLK
and then re-enable interrupts.

Pin /S5 of the cartridge port is the /CS for the cart. It will
be low whenever the Atari accessed memory in the Area $a000-$bfff.

Now for the software part:

Actually, the Atari doesn't use TRIG3 to determine if a cart
is present, but examines the bytes $bffa-$bfff (this makes sense,
otherwise the builtin basic wouldn't work).

$bffa and $bffb contain the start address of the cart (lo/hi).
$bffc must contain 0, otherwise the cart is not detected!
$bffd is the cartridge option register (see below)
$bffe, $bfff contain the init address (lo/hi)

Three bits of the option register are used:

If bit 7 is 1, the cart is a so called diagnostic cart. The
init routine of the cart will be called at a very early stage
of the boot process, before the hardware chips and memory
are initialized/checked.

All "standard" carts should have bit 7 set to 0.

Bit 2 denotes if the cart should only be initialized (bit 2=0),
or if should be initialized and also started (bit 2=1).

The init routine is called at a very late stage of the boot process, just before opening the "graphics 0 screen" (and also before booting from disk, but all other hardware chips and OS memory locations are set up properly).

The init routine should end with RTS, after that the text mode screen is opened and the boot process continues.

Bit 0 denotes if booting from disk/PBI devices is enabled (0=don't boot, 1=allow booting). This is useful for all carts that may require a DOS, most games don't allow booting so that it is harder to copy them.

Now the Atari tries to boot from floppy and/or PBI (if allowed).

If the boot process was unsuccessful (eg no floppy present), or if the boot process returned normally, the cartridge start routine is called (but only if bit 2 is set to 1).

In case bit 2 of the option register is set to 0, the boot process is finished by jumping through DOSVEC ($0a).

I hope I didn't mix up and 0 with 1 bits :-)

so long,

Hias

Probably at least half of the cartridge images floating around as binary
load and go files were made with CARTCOPY. It has been a while since I
fooled with it so I don't know the exact numbers but all of them just
had a bit of code prepended to them. That is, you will find the same
exact code prepended to all of them and they will all be the same
length. Most of these will only run in Atari 800 mode as they made an
illegal call to the OS.

Your eprom burner should have some kind of monitor that came with it.
What you should be able to do is just load the file then find the end of
the header, a few more bites to skip for Atari file format, the ROM
image, then a few bites appended to the image for run address that you

could probably ignore.

It will look like:
255 255 ;Atari indication of a binary file
xx xx ; Load address of the start of the patch
xx xx ; End address of the patch
some code to lower the screen
and do some house cleaning Total bits can
be calculated from the
I get a little fuzzy here but I think initiate
code gets another
255 255
~$E1 $02 ; Somewhere around $02E1
~$E2 $02 ; two bites to tell DOS where to jump
~$FA $BF ; Can't remember jmp loc either, somewhere in cart like $BFFA
255 255 ; another binary
$00 $A0 ; Start loading at $A000
$FF $BF ; End load at $BFFF
Cart data $2000 bites
255 255 ; Binary file
$E1 $02 ; Init vector
$E2 $02 ; address again
The address to jump to start the cart.

It may be easier to just count 8 bites back from the end of the file,
but you never know. At this point you should be able to tell your burner
where to start from and the length to burn. You will mostly be looking
for a chunk ~40 bites from the start of the file and 8 bites from the
end. It should alway be $2000 bites long for 8k carts and $4000 bites
long for 16k carts. Sometimes carts had their init and run vectors
modified to trap reset. They should both be restored to the numbers you
can get from the file in your monitor to work right.

Source record: 12187

I have been reading with some interest, descriptions of various hacks
for the Atari 8-bit. I am curious to learn whether or not anybody has
ever attempted to completely redesign the Atari 8-bit?

I mean, has anybody ever thought of producing the Atari 8-bit that Atari
would be selling today if they were still producing the funky little
machines?

I would tend to think that a completely redesigned Atari could be both
backward compatible and still offer greater performance and
functionality. You wouldn't necessarily have to stick with an 8-bit
processor and bus. If the core elements of the 8-bit architecture were
left intact, it shouldn't really be too difficult to incorporate newer
technologies on a completely redesigned Atari 8-bit motherboard.

There would be cost considerations, of course, but this would be a
project for those that have a love for the machine.

is a partial transcript:
Hackerbook for your ATARI-Computer
Tips + Tricks by H.C. Wagner ISBN 3-88963-172-X
First Edition First Printing (c) 1983 by Winfried Hofacker
Chapter 6 pg 43 HOW TO MAKE A BOOTABLE CARTRIDGE
Preparing the program.
Most of the games and some other programs written in machine
language
are stored in a cartridge. Booting a program, the OS recognizes
the cart
and starts the program.
What do you have to do when you want to make a bootable cartridge
of your own program?
As an example we will make a cartridge with a program for testing
memory. The bit pattern:
10101010 = $AA
01010101 = $55
11111111 = $FF
is written in every memory location starting above the hardware
stack
at address $200. First the content is saved, then the bit pattern
is written
into and then read from the memory location. If there is any
difference
writing and reading the program prints an error message: ERROR IN
<ADR>. Then the program waits in an endless loop. If the message
is
ERROR IN A000, the RAM is OK because $A000 is the first address
of our ROM in the left cartridge.
The address range for the left cartridge ranges from $A000 to
$BFFF
and from $8000 to $9000 for the right cartridge. As starting
address
for our memory test program we choose $BF00. This is the last
page
of the left cartrudge. The software for the EPROM burner is also
stored
in a cartridge. Therefore the object code generated by the
assembler is
stored at $9000.
Like a bootable program the cartridge has a header. The following
scheme shows the outline of this cartridge header.

```
+-------- $BFFA or $9FFA
! cartridge
+-
! start address
+--------
! 00 zero
+--------
! option byte
+--------
! cartridge
+-
! init address
+-------- $BFFF or $9FFF
```

The header for the right cartridge starts at $9FFA, for the left cartridge
(more important for us) at $BFFA.
- The first two bytes contain the start address of the cartridge.
- The third byte is the cartridge-ID. It shows the OS that a cartridge has
been inserted. It must be 00.
- The fourth byte is the option-byte. This byte has the following options:
BIT-0 = 0 don't allow disk boot
= 1 allow disk boot
Bit 1 is unused
BIT-2 = 0 only initialize the cartridge
= 1 initialize and start the cartridge
Bits 3-6 are unused
BIT-7 = 0 Cartridge is not a diagnostic cartridge
= 1 Cartridge is a diagnostic cartridge;
before the OS is
initialized this cart takes control

- The last two bytes contain the cartridge initialization address.
The initialization address is the starting address of a program part which
is executed in advance of the main program. If there is no such program
routine this address must be the address of an RTS instruction. In our
example the low byte of the starting address $BF00 is stored in location
$BFFA, the high byte in location in $BFFB.
The option byte in location $BFFD is 04.

The program in the cartridge is initialized and started, but there is no disk
boot. The initializing address $BF63 an RTS instruction within the program.

After assembling and storing the object code the burning of the
EPROM can start.
page 45
<the example program assembly listing follows, which ends:>
ORG $BFFA, $90FA
BFFA: 00BF DFW START this is .word
BFFC: 00 DFB 00 .byte
BFFD: 04 DFB 04
BFFE: 63BF DFW FRTS
page 49
That is it, the entire chapter.

Yes.

The various custom chips (and perhaps the CPU) would be in one chip.
It would use a cheap PS/2 kbd and mouse, have USB, IDE, SD cards, LCD, etc.

> I would tend to think that a completely redesigned Atari could be both
> backward compatible and still offer greater performance and
> functionality.

I don't think you can have it both ways, which is why technology
periodically has to ditch old stuff.

You can always run an emulator to satisfy your wish list.

I suspect some of the few reasons one might want a specialised hardware
solution include:

- smaller system box
- much lower power consumption
- easier for hobbyists to interface projects with
- could be built into stuff economically

> There would be cost considerations, of course, but this would be a
> project for those that have a love for the machine.

I don't love it particularly, but I think it was the most sophisticated of
the 8-bitters due to the full-custom chips. All had their pros and cons of
course. The C64 had good sound chips, The 800 had a slow serial disk, the
BBC had the best BASIC, and so on. But for games, the 800 was best.

I've managed to get a good foundation system going.
PS/2 kbd & mouse, PAL/NTSC/SCART output, Flash ROM, memory paging, USB slave
port, LPT slave port, RTC working.
The CPU / VDU timing matches the 800 well.
Still lots of work to do implementing ANTIC and the P/M graphics.

After that it should not be too hard to port existing IDE / CF /SD
interfaces onto it.

The Apple IIe and IIgs already have IDE, and CF capability.
SCSI was always an option. But, as you have said so graciously,
the Atari 8-bits were the best, with the specailly designed
processors. Games on the Apple II, even the GS series, just
don't compare to the wonderous graphics and sound of the
Atari 8-bits.

Good evening and have a pleasant tomorrow. :o)

From: Bill Garber <willy46pa@comcast.net>
Message-ID: <X-CdnZ_VOo7JMbvfRVn-vA@comcast.com>
Source record: 12195

Is there a source for these. Again, I'm searching the
internet for one. Or even two, but I can find nothing.
When I made carts in the '80s, they were plentiful, but
now there are none that I can find. Any help appreciated.

Thanks,

Sorry!

Just to let you know, I *DID NOT* send you an email to complain about your efforts! And I did not mean to sound like I was complaining about your efforts! If it appeared that way, then I am sorry!

Infact, I applaud you for trying to offer them! I am sorry there are jerks out there who are NOT nice about you trying to offer them! :-(

Once again, I *DO* THANK YOU for trying! It just didn't work for me at the time I tried BUT I know it's *NOT* your fault!

Sorry for those who have offended you or complained to you about your efforts! It's SAD that some people have nothing else to do BUT complain! :-(

Well, I guess I worded it a little wrong... sorry! What I meant is...

If MEM.SAV is on the disk, then the program you typed in will be temporarily saved to the MEM.SAV file when you type DOS to go to the DOS menu (DUP.SYS). When you exit the DOS menu, then your BASIC program is re-loaded from the MEM.SAV file. If the disk you are using doesn't have this, then you need to go to DOS menu and create it. This file is just a temporary storage and makes it a little easier if you are bouncing back and forth alot between BASIC and DOS menu. I recommend that you save your file, by regular means, though, each time before you go to DOS menu! You never know if something will happen which might corrupt the MEM.SAV file! At least you should have the original just in case it does happen! I recommend using the LIST command to save your file if it's really important! Because, depending on the version of BASIC you are using, the file will get bigger and bigger or might become corrupted by the SAVE command. I think this happens in Rev A & Rev B. Supposedly, this was fixed in Rev C.

That's a GOOD reference site! Thanks for that! I haven't been into the scene for awhile so I didn't know where to find DOCs such as those!

To start, I recommend Inside Atari DOS and Atari BASIC and/or Atari BASIC XL Edition. If you are going to program extensively in BASIC or ML, then there are several others there that are GOOD reference materials too... MUCH better than most of the reference manuals that Atari had put out! If you really want the Atari reference manuals, I think they are out there somewhere *BUT* I think you should be able to find just about anything you need from this ONE site! So, again, thanks for the link! Just what this person needs! :-)

Correct me if I am wrong, as far as I know, you CAN'T read ATRs on any of
the DOSes on the Atari! Maybe there is a util that can read them on the
Atari? Otherwise, you can ONLY read the ATRs in an emulator on the PC!

BTW, I believe you will have to attach the ATR as a harddrive (H1:, H2:,
etc). When you do this in the emulator, then you CAN read the ATRs using
the DOS from the emulator. I think you need MyDOS for this, though?

It depends on the ATRs you are trying to read... Games001, MegaImages, Yogi,
etc, should list just fine and you can even copy the file from the H1 drive
to another drive. If it's a disk game, such as Conan, Seven Cities of Gold,
etc, then there won't be directories on these,. of course! Or as I suggest
below, use an ATR util on the PC and you should be able to view and/or
extract from an ATR with *NO* problems!

> If I could just find one ATR that I can view with DOS, just so
> I know it can be done, then I might be able to put some of these
> games onto eprom. I have the SIO2PC and 3 SIO cables coming so

Use an ATR program to read them! Ken Siders has put out a few ATR utils
which you can use with ATRs to view, modify, etc. You can even extract
files from the ATR too, I believe.

Man! That's a HARD decision to make! Whether to sell it or hold onto
it!?!?

I seen one posted by someone else here in the newsgroup which the final bid
was $222.50 US!!!

That's just enough to tempt me to go and find mine and sell it NOW! Even
rarier, I think, is the RT8 cart!? However, I don't know how much that
would be in demand?

If there is enough demand or requests for it here, then I will go and dig
them out and put them on eBay and you guys can battle it out!!! :-)

Hi All,

Would it be possible to build an Atari 8-bit computer today with parts
that you could buy new? A question like this was recently posted on
the Commodore news group. It's an interesting question.

I'm not talking about a super expanded version (Like the Commodore
One, for those that are familiar with that.) I mean just a garden
variety 800XL or 130XE.

John

It's all very well getting SATA/ATA & IDE/USB working on an A8, what i'd like to see someone do (and i think it could be possible) is for someone to hack a modern gfx/sound card, to get it working with an A8, upgrade the a8 to either a 32/64 bit version of the 65816 proc, or later versions of the 68k series, if you cant hack a modern gfx/sound card, why not have a go at the AGA/Pre AGA amiga hardware and hack that into an a8, plus ofcourse the standard pc expansion devices like PCI/ISA and/or AGP slot, and lastly give it a tower config. as i prefer tower to a desktop config. (easier to upgrade)

I'd noticed. Mr Atari did the MyIDE for the 800.
So should be easy to get IDE into the glue chip.

Although it may be fun to say "hey, I've made an 800XL with a 250 Gig drive!", I don't know what I would need that much for. It would take ages to just read that much data out.

Therefore I think a memory card would be plenty, and robust enough for kids to drop now and then.

You may say that it would get worn out if used heavily, but the 800 was not a big disk user. Mainly due to the slow transfer rate.

I've got 512K of paged SRAM that can be battery backed, so that could be used for editing small docs before finally saving to card.

> Games on the Apple II, even the GS series, just
> don't compare to the wondrous graphics and sound of the
> Atari 8-bits.

True, but some people are still fond of them and they still do what they did back then.

Many home-computers of the 80s are good enough for many jobs, e.g. controlling small processes/experiments/telescopes, and their main drawback is that they are getting old, spare parts are harder to find, they are rather large, and so on.

Now that I have a 65C02/FPGA system running, I can do a lot of fun things I couldn't / wouldn't do with a PC. :-)

And the only option is either 250gig or nothing, eh?

I personally have an 80 MB hard drive (connected through KMK/JZ IDE,
which is IMHO a lot better than MyIDE) and I can tell you that it is
extremely convenient to have such a fast and high-capacity data storage.

> the DOSes on the Atari! Maybe there is a util that can read them on the
> Atari? Otherwise, you can ONLY read the ATRs in an emulator on the PC!
>
You can load an ATR into APE and read it with your 8-bit CPU. APE is a peripheral emulator not a CPU emulator. You still need a real 8-bit CPU and an APE (or SIO2PC) cable to use it but then DOS will access it just like a regular drive.

> BTW, I believe you will have to attach the ATR as a harddrive (H1:, H2:,
> etc). When you do this in the emulator, then you CAN read the ATRs using
> the DOS from the emulator. I think you need MyDOS for this, though?

the H#: device works with a PC folder only - you can't attach an ATR that way. To attach an ATR to the emulator mount it as a D#: device.

BTW, I do this all the time and I do not use MyDOS for anything - in fact I cannot remember the last time I loaded MyDOS. I use Sparta DOS 99.9999% of the time.

It's always been possible to get better graphics by hacking something in,
but then what? There's no software that takes advantage of it, and if it
isn't out there no one's going to write software for it. Sort of a chicken
and egg problem.

Perhaps if support (for this hypothetical graphics upgrade) were programmed
into the emulators then people could get programming stuff for it.

I have one of these that has been converted to use 3.5" disks, but I have no documentation for it. I've search the Internet hi and low and there isn't much out there. Does anybody have any information on this piece of hardware? I understand you can attach slave drives to the unit, but I'm not sure how to connect them. There is a DB15 connector on the back, does anyone know what that is for? Also any information on the jumper and dip switch settings would be appreciated.

New with manual?

Yeah, I think you'll get a good price for them. They are probably quite rare.

You might also be able to leverage a nice trade if you need anything.

Do you know what version(s) you have. The last was ver. 3.6 but I'm not sure it was ever sold straight out. I got mine as an upgrade from OSS.

Can you see what color the cartridges are?

The newest ones were orange with a yellow label but that doesn't guarantee the version number. My first cartridge was version 3.1, also orange.

I never saw the older style cartridges but I think they black with a yellow label. I don't know which cartridges had which range of versions.

No, of course not.

Even a modest few megs of magnetic drive provides enough space to edit a few
docs.

> KMK/JZ IDE which is IMHO a lot better than MyIDE

I've not tried either but If you recommend it I will check out the JZ IDE
interface.
Where would I find details?

> and I can tell you that it is extremely convenient to have such a fast and
> high-capacity data storage.

I assumed memory cards were also fast, their only downsides being less
gargantuan storage and more finite write cycles.

Certainly if you are happy to have a modest capacity then you could use a
Microdrive, since these fit in a CF card envelope.

Looking for the "warez"? That's funny!

Pretty much all Atari 8-bit software is available free as freeware,
shareware or abandonware. Atari 8-bit support has been long dropped by
the publishers. I don't think it's even practical to tag Atari 8-bit
software copying as software piracy.

I don't think software publishers care too much about what you do with
their old Atari 8-bit products, as long as you don't try to profit from
their distribution.

Attaching a DAC or an FM synthesizer to the PBI might not be too complicated (FM chips can be found socketed in things like the Sound Blaster 2 and Sega Genesis, and there are lots of music files around for these chips which would be easy to play on an 8-bit). If you're thinking of something more modern then how about an OPL4 with lots of RAM?

>, to get it working with an A8,
> upgrade the a8 to either a 32/64 bit version of the 65816 proc, or

One of my fantasies is incorporating the Atari Jaguar chipset into a souped-up Atari computer. 1/2/4/8/16/24-bit color, resolutions up to 720x480, blitter, object processor, etc.

> that into an a8, plus ofcourse the standard pc expansion devices like
> PCI/ISA and/or AGP slot, and lastly give it a tower config. as i
> prefer tower to a desktop config. (easier to upgrade)

Eventually there will probably be an Atari 8-bit core for the C-One, you can put that in a tower case (IMO towers are ugly, LOL). Maybe it will use the 20MHz 65816 with access to loads of RAM. It could have enhanced gfx the clean way by adding more modes/commands to ANTIC's instruction set.

Storage capacity in CFs is not a problem (they're big enough), but the
number of maximum write cycles may be a problem, yes, especially for
such areas as VTOC or lookalikes (disk map under SpartaDOS).

Microdrive is the name IBM use for their hard-disk-in-a-CF-envelope.

It is a tiny 1" or so platter.

Uses rather more power than a CF of course, but doesn't have write cycle
limits of CF.

: "pool disk" or any ATR games?
: THX Greenbird

Most of what I could give you are emulator version files.
You would need to get an SIO2PC and transfer them to real
disks or for ROMs burn them to eprom and insert into carts.
That's what I'm doing. If you need something specific, then
I might consider sending you a disk or two. Once I get my
own SIO2PC going that is. I don't know when that will be.

Also, Google is your friend. I didn't ask until I exhausted
all of my searching the net myself. Good Luck.

Most game disks you will want to boot while holding "option" to
avoid loading basic.

If you want to load a binary (.com) for instance you need to load a
DOS diskette first (from basic type DOS). Follow the menu for your
DOS (I use MYDOS) which is "L" for load then simply type the file
name if your drive is drive #1 (or only drive).

Check the Atari 8-Bit FAQ for a wealth of info.

Great idea, thanks. Wish I'd thought of it. :o)
Really, it is a good idea, since I don't plan
on burning any 8K roms. My other idea is just
having 3 actual carts with Zif socket, cut out
a hole in the case to insert just the chips
when you want to play. Any thoughts on this??

I suspect something is wrong with the 1050.
You need to describe what happens better.
Is this an 800? Or 800XL? If it is 800, then you might get a blue screen
if the computer doesn't recognize the drive.
I presume you've connected the SIO cable, power adapters, and monitor or TV.
Does the 1050 light come on when you power on the computer? You should turn
the drive on, put the disk in, close the door and turn the computer on. I
can't say whether your computer is working. If an 800, you could see if a
cartridge works, (left slot).

Yeah, I like the Flashcart. There is one for the Apple II
also. A friend made a few and sent me one that I use for
games on the Apple II. Works like DOS on a cart like the
InstaDOS cart for the Atari 8. I also bought that. Not sure
how to get into the built-in Basic though on the XL. Anyone
know how to do this??? Seems the cart is at the same location
as the built-in Basic.

Just looked at the auction, and have thus (for the first time) seen
what the initial "toast-rack heatsink" version of the 128K looks like!

I don't know what's supposed to be so "rare" about it, however, other
than the fact that 2 out of 3 eBay listings use that adjective,
justified or not...

Most .COM files require that Basic not be present so you would
'boot' directly into DOS without the cart.
The 'boot' process begins with all components powered 'off':
1) connect 800 to drive configured to D1:
2) power 'on' drive
3) insert disk after spinning stops
4) power 'on' the 800
Bootable software like DOS and disk games will load & execute
at this point if drive and disk are functional

I'm sorry, I assumed that you were familiar with such things as Google.
I guess I was wrong!

Here's some help for you:

In the URL space at the top of your web browser type:

http://www.google.com

Once Google appears on your web browser, type "Atari 8-bit software" in
the search field. Click search and download till your heart is
content.

If your abilities preclude you from performing such "advanced" searches,
email me with a list of the software that you are seeking and I will
personally send you the "warez" you desire.

Squaked, Chirped, Flapped his wings and Flew away.

The 128K+ is 'rare', as it was released shortly before Amstrad bought
out Sinclair. Only 70,000 were made, and Amstrad did not continue it's
production. And they killed off the QL :-(

Hi, Still no luck! when I turn computer on nothing happens, maybe its the
cable.
The atari 800 works, well cartridges do. The only time the 1050 works is
when it is switched on or when I put a disk in. Any other ideas?

Well I dont know about chips, they would definitely bend and break after a few hundred pulls 8-).
I would go with something like a SIM. Better would be a module like the tandy model 100 uses for memory, a sort of chip on a small piece of PCB. That would work well, you'd only have to worry about losing it.

OK, cartridges work. OK, the disk drive is operating, makes noise when
turned on or disk is inserted and the door closed.
How about this? Look in the little retangular hole in the back of the
1050. You should see a black (or white) plastic switch sticking up. Both
the white and black ones should be to the left. It is the drive number
selector. If one or both the switches are to the right, then the drive
isn't configured as D1:, which it must be for the computer to boot from it.

Don't you know what a ZIF socket is. It has a lever that releases
the pins of the chip, you simply lift it out. There is no force
involved during insertion or extraction. Look it up, ZIF socket.

I'd guess $222 is probably more than most would pay. I did because I have a pressing project and I want to see how the "experts" did it. My goal in fact is to remove the necessity for Spartados X and provide something of a similar nature. To understand the beast, one must study the beast, and I wouldn't guess many people would pay as much.

Also, from my perspective (as a Brit), everything on Ebay is half-price.

ATB,
Simon.

Yes and no.

Yes: all needed custom chips are still available (NEW chips) in special stores (like Best Electronics). So it is technically possible to build a new one. But I guess this is not exactly what you are trying to ask. And that is why the answer is also 'no'

When these custom chips are all sold out. It is not possible to build a 100% real atari anymore. These chips are non-standard, and as far as I know, the factory data sheets (to build new ones) are still secret. It might be possible to build compatible custom chips (using microcontrollers like the ATMELS etc) but even then, i wonder if it will be 100% the same.

Hmm. Are you sure? ICD carts were black. FTE carts (that I saw
advertised) were black. Who released the newest orange ones? Unless
there were some older orange stock that was updated and sold by FTE.
(?) Orange carts almost always had 2ea. 2764 eproms or compatible
roms. Black carts had 1ea 27128 (ep)rom. Version number is at $B000
from the monitor. =6 (V3.6) =5 (V3.5) (etc.)

No, Carmel meant Sinclair's proprietary storage device which was a big loop
of tape in a cartridge. Now deader than 8-track cartridges...

Who makes it, who sells it, how much, what does it look like, where can I find the circuit diagram, what advantage does it have over similar products, what parts does it use, how much current, is it a commercial product or just a one-off some guy made, why doesn't it have a web page, does it come with a manual and source code, is the user interface in English or not, and so on.

Version 3.6, orange cartridge here. A direct upgrade from OSS. Invoice
is dated March 22, 1984, ($20 USD)

Previous version was 3.1, also an orange cartridge. I don't have the
receipt for that original cartridge so I can't tell you the date I
purchased it.

The cartridge is glued shut so I can't/won't verify the EPROMs.

I thought we were talking about original OSS cartridges. It's just that
my cartridge definitely is orange and definitely is version 3.6, the
last version produced, so I just assumed the orange carts came last.

I see now that ICD made a deal with OSS in 1988. I vaguely remember
hearing it at the time but had pretty much had dropped the 8-bit hobby
before any products were re-released. Frankly, I didn't even know that
OSS products had ever resurfaced at that date or beyond.

Obviously I goofed.

Sorry if I confused the issue.

A couple questions:

Since I have been wrong all along exactly how does one identify
different releases of Action!? Were the later releases of Action!
carrying labels other than OSS, for example ICD/OSS, ICD, or FTE?

Ask him for current pricing. Available items are sold on Ebay or Allegro
anyway.

> what does it look like

This is sort of cartridge fitting in ECI+CARTRIDGE slot in XE computers.
The box is about 1,5 cm high, 15 cm long, and its width is less or more
equal to the XE ECI+CARTRIDGE slot. You have an ECI+CARTRIDGE connector
at one end, and an IDE cable at the other end. The whole is cased with
black plastic case.

> where can I find the circuit diagram,

Nowhere, this is not a public domain item.

> what advantage does it have over similar products,

1) it is available and still being made;
2) the software is maintained, you can download an upgrade for the
internal handler, for example;
3) it uses a well defined Atari parallel bus interface, thus no OS
modifications or other hacks are necessary to get the machine booting
from this device;
4) it works fine with unmodified SpartaDOS X, SpartaDOS 3.x, MyDOS (and
other DOS-es, but using it with DOS 2.x lacks sense);
5) it allows you to make true partitions (up to 16);
6) it can currently address up to 8 GB (and this is not a hardware
limit, so an upgraded internal ROM can do more);
7) it works with all devices which are ATA-compliant;
8) you can use two drives (master/slave);

> what parts does it use,

Plastic case, cable, PCB, an EPROM, a number of other chips, a LED, a
bit of tin; a wire, perhaps.

> how much current,

Standard Atari power supply is enough (it may not be enough for the
drive, however, this depends on the drive).

Well, I don't remember since it's been awhile so forgive me!!! :-)

I do know that you have to do it a certain way in order to read an ATR in
DOS. It's NOT as simple as attaching it to a drive and then using any DOS
to read an ATR like a regular disk directory. It DOESN'T work that easy! I
KNOW that the Atari DOSes (2.0, 2.5) can't read an ATR directory! I wasn't
sure about the other DOSes, except for MyDOS and so that's why I mentioned
that one. I couldn't remember how I did it, BUT I know you CAN read them if
you have the right DOS!

Thanks for the input, though! :-)

One program to read/work with ATRs is called ATRUtil. However, it seems to have been pulled. It was written by Ken Siders BUT it's not on his site now?

I think there are other ones too that works with ATRs but I don't know them right off hand. If you go to ftp.spudster.org, you might find it there or find similiar ATR utils?

If you can't find it or a similiar util, let us know and one of us can send you a prog that works with ATRs.

It was designed as an interface for XE computers, yes. The reason is that the wast majority of Ataris in our country are XEs. It is possible to make an adapter for XL bus, they're electronically very similar (not identical, though). As far as I know, Jurek is currently working on such an adapter.

This device cannot cooperate with 400/800 series, because these computers lack the PBI functionality added in XL/XE series.

When you insert carts, I think they usually disable BASIC because, usually, that area is used by games/programs for data, etc. Unless there is an option to start this cart with BASIC, I think you are stuck without it! I guess Steven Tucker would have the answer to this question!

Have you tried holding down the Option key when you turn the computer on???

If it still doesn't work, are you getting any signals (beeping sounds) when it is reading the drive? While it's reading the disk, you should get beeping sounds that it is reading from the drive. One beep for each sector it reads. If not, then you probably need to check and see that it is set as D1: as Russ suggested and then try again! Be sure to hold down the Option key while turning the computer on! Once it starts reading the disk, you can release the Option key.

You indicate you are using an 800 (not 800XL)? If you were using an 800XL, then you might need a translator disk to load the 800 OS into the XL prior to starting the game. Several games will only work under the 800 OS. SOME games will only work on the 800 XL but this is much rarer than the former. Does the disk have a title on it? Is it a game? If it's a DOS disk, then you should get a blue screen with a "READY" prompt or it will go to the DOS menu if you are holding down the Option key. If you have a DOS disk, try it and see if it works. Try other games (holding down Option key).

If you tried all the suggested solutions, you might need to get another drive that you know is in working order and try loading that disk again. You can buy one from one of the reputable dealers that are still around! There's also a chance that the disk you are trying to use is old/damaged and may not work! There are MANY things to look for so to try and narrow it down and get help from this forum is HARD! Probably the best solution is to send the drive to a reputable dealer and have them check it out for you. If it's NOT the drive, then it could be the computer! To save you time, you just might want to send the computer along with the drive and have them checked out at the same time. Or, if your lucky, find someone near you who can do this for you.

Let's see if this arouses some interest...

I have a extra Sparta Dos X V4.19 and manual that I'd entertain a
trade for something "special". And I mean "special". Emails, please.

As suggested, just use Google to find a TON of stuff on the Atari!

Here's a search engine just for the 8-bit...
http://www.newbreedsoftware.com/xlsearch/

You should find what you want from the above link!

They are BOTH equally good! To say which one is better than the other is
just NOT fair, I don't think!

I think they are both EQUAL!!!

Sure, one can do something that the other can't do and visa-versa, BUT,
overall, I think they are pretty much equal in graphics, sound, quality,
etc. So, as far as I am concerned, I can't really say which one is better
than the other!

I have my own Trivia Pursuit from Professional 1984. It is my favorite one but the disk has many bad sectors. :-(I was looking for the Trivia image disk thru FTP or Holmes FTP. I could not find it. Another Trivia Pursuit clone I found is not from Professional company. I want Trivia Pursuit from Professional company. If anyone find it thru ftp or anyone have own, please let me know...

Thanks!
Jack

You have to find and download the game!

He gave a link to a forum for M.U.L.E. which you probably can get a link there for it. Or you can probably can find it just by searching Google for it. It's really NOT that hard to find it!

He was just advertising for the (his) forum. I don't think he was looking for ways to spam!

You need NOT be so critical here! MOST people here are nice and don't do things like this!

If you are talking about PC utilities to create ATRs or extract files from an existing ATR then MakeATR (see link) is a good one. It builds or extracts files from ATRs containing the following DOS formats: Atari DOS, Atari DOS II+/D, SpartaDOS X, and MyDOS.

MakeATR has a hex viewer but no hex editor so it would not be of much use with boot ATRs that don't contain DOS files or files of any kind. These just have raw sectors..

If you are talking about trying to open an ATR file using an Atari. IWell, 'm not sure why you would want to that.

If you are mounting an ATR using SIO2PC or APE software (or equivalents) or an emulator then you need to be booting the correct DOS, meaning a DOS which is compatible with the file format of the ATR you wish to use. For example, if you boot MyDOS then you can't read SpartaDOS disks/ATRs and vice versa. Both MyDOS and SpartaDOS can access DOS 2.0 disks.

Accessing ATRs requires following the same rules as accessing real disks. Some formats just aren't compatible with some DOSes.

Link to MakeATR

www.makeatr.prv.pl (seems to be having problems at the moment).

I am not sure about CSS? However, the website is still here...
www.nleaudio.com/css It hasn't been updated for about 5 years now, though.
So is it still in operation... I am not sure?

About FTe/ICD... this is one of the BIGGEST mysteries in the 8-bit
community! We pretty much consider that one dead around here! The guy who
bought *ALL* the ICD line of products started with a big bang and then
rapidly fizzled out! I think he produced one (shareware, I think?) version
of DOS and was advertising the other products in the ICD line but then, for
some reason, he vanished not very long after he started! I don't even know
if he actually sold anything to anyone!!! If I remember, at that time,
people were ordering stuff BUT never got anything! He had plans to
distribute new stuff but NEVER did! As far as we know, he just vanished
into thin air... NEVER to be heard from again! Maybe he went bust and had
to get rid of everything!? I don't think NOBODY really knows what happened
to him!?!?

Ok, so i got a 130xe from a jerk on ebay
(long story, he stiffed me out of the power
supply and didnt look like the one in his
picture anyway) and its got a bad keyboard.
A trace is apparently cracked, I but cant
seem to find which one to even attempt a repair.

I hate to put much more $ into this, since i dont
know if its got other issues too.. sooo.. does
anyone got an extra keyboard they might want to
part for a few bucks? Even if its yellowed i
wont mind, as i can always look for a better one
down the road if this thing works.

Considering they moved on to 16 bit machines, and later 32 bit
machines i dont think Atari would still be making 'the little
funky machines' even if they were still alive...

Backwards comatiblity would be tough as well at this point, since
most likely they would be using PPC chips, which are a different
animal then the Moto 8/16 bitters were.

Emulation is your friend.

Yes, I captured $A000-$BFFF and it was BASIC,
the same space as InstaDOS. Still there must
be something that lets BASIC run. If I had an
Atari 800, I could insert the cart into the
right slot and BASIC cart in the left and see
if I get both, but I don't sad to say. Where
can I get that software that captures actual
cart programs?? I can't even remember the name
of it anymore.

Actually 'vice/versa' is not correct; Sparta can read both
Atari 2.0 and MyDos formats.

The only way to read an ATR/XFD on a real A8 is with
a suitable utility like APE or SIO2PC which make the Atari
believe they are actual drives. You always need some form
of interface because the A8 will ask for a specific sector
number and that must be translated into the correct portion
of the ATR data and then respond in suitable SIO format.

It is fairly easy to create A8 utilities to write a disk from the
ATR; the trick is you need DD (180K) or ED (130K) storage
for the SD (90K) ATR because it will not fit on SD 88K disks.

I remember talking to the FTe/ICD guy at the last Toronto Atari
Federation Convention in Toronto, Ontario. I think I still have his
business card kicking around somewhere.

He was talking about some really interesting products at the last
Toronto show. He even had a couple of prototypes. I just haven't
heard anything about him or his products since.

Although, I left the Atari scene not too long after that convention, so
I don't really know what has been happening in the Atari world. I'm
just getting back into the 8-bit scene now.

Nostalgia gets the best of me.

Apple moved from the 68K processors to the PPC with very few problems
and really good backward compatibility. I don't think it would be too
tough to revamp the 8-bit Atari and still maintain decent backward
compatibility.

It would take some OS wizardry by some clever coders, but I don't think
that it would be anything approaching the realm of the impossible.

Certainly.

However it does take time and effort to do so.

I'm working on it between distractions.

The Flashcart has the ability to turn itself off, so I guess that is how it
can utilize basic. I've never put anything on one of mine that requires
BASIC so I haven't seen how it works.

You will be better off buying the mylar insert from Best Electronics and replacing that. The factory mylar is notorious for failure. If you get a used keyboard, it may fail on you very soon.

You're probably talking about 'cartcopy', or maybe 'The Impersonator'. I
don't know what InstaDOS is, apparently a DOS on cart that takes up the
A000-BFFF memory and does'nt allow BASIC to run.
I don't know what you're trying to accomplish.
If you really want to copy original carts, the best way is a Omnimon OS.
But just about every cart ever produced has already been dumped and is
available, either as a ROM image or cracked to run as a load file.
There may be other OSes that have a machine monitor, I just don't know any.

Are you mounting ATR's in an emulator or thru APE or another peripheral emulation setup?

Perhaps you have some bad ATR's because it DOES work very easily here - in fact it works exactly like the real hardware did. The ATR image acts like a drive.

Perhaps it is the "DOS rules" (or whatever you want to call them) that are confusing you. Basically, the same DOS rules apply to the ATR images that applied to the real floppies using real hardware back in 1985. For example, if the disk format of the ATR image is DOS 2 and it has a directory, then Atari DOS 2 will read that directory in the ATR just like a 1050 reads a floppy disk. DOS 2 will not read a SpartaDOS disk but that is due to disk format incompatibility - it has nothing to do with it being an ATR file. And if you try to use DOS 2 (or any other DOS) to read an ATR of some 'Boot Disk' formats you might get some garbage... the same garbage you would have gotten back in 1985 with the real hardware.

The only trouble I have ever had with ATR images is formatting some hard disk images using older versions of the emulator... but I never had those same problems when formatting the same images thru APE, so I figured it was an emulator issue - that may be fixed now in a800win plus. I haven't tested since I started using the plus versions.

OK, I see that after booting with SpartaDOS I can read MyDOS 4.53/4
ATRs but not MyDOS 3.18 ATRs (which were created from my own early
1980's collection of disks). Newly created MyDOS 3.18 ATRs aren't
readable by SpartaDOS either so it's not a problem with the original
disks or the process of converting to ATRs.

Steve Sheppard.

I cannot say what weirdness happens with your ATRs, but
with real disks - Sparta above ver 1 contains a 2.0S kernel
for accessing single or double density media with Atari Dos
sector layouts. These Dos 2.0S compatibles include Dos 2.5,
TopDos, DosXL 2.3, SmartDos, K-Dos, MyDos 3.011,
MyDos 3.018, MyDos 4.3, MyDos 4.5, MyDos 4.53 and
probably others; they are all 40 track by 18 sector = 720.
1, 2, 3 are boot; 360 is VTOC; 361-368 are Directory;
data sectors are 125 byte w/ last 3 as link & count. The DD
versions continue the pattern in a 253/3 byte system; several
also extend to DSDD or DSSD eliminating the file number bits.
All MyDos versions use this same 2.0S configuration. Sparta
will read them all...

Hello Bill,
you are right in some way, LOAD"C:" and SAVE"C:" do also work to load/save tapes, but it takes much longer to load and/or save a tape that way (almost twice the time) than using CLOAD and CSAVE. The difference is the gap between the data, with CLOAD we have short gaps, with LOAD"C:" we have long gaps. and you know that loading a tape usually takes very long, so this is an easy way of saving some loading time (use CLOAD/CSAVE instead of LOAD/SAVE "C:")... -Andreas

Hello Konrad,
it is very nice, you want to answer all questions about the KMK harddisk interface. But why not create a homepage, so you do not have to answer the same questions again and again... here are my questions:

1) does the KMK interface connect to the XL parallel bus, the XE cart port + ECI , the SIO port, the cart port or what ?!?

2) maximum number of partitions available ?!? (Myide = 8, msc-ide = 240)

3) maximum partition size (standard = 16 Meg.)

4) does the harddisk then work with files only (under DOS or Gamedos) or does it also support disk-images/boot-disks (like MyIDE) ?!?

5) 16bit or 8bit data transfer ?!? support of other items like CD-ROM, DVD-ROM, ZIP drives and such that require 16bit data transfer ?!? (msc-ide = 16bit, usage of CD ROM, ZIP drive and DVD ROM possible; MyIDE = 8Bit, usage of CD ROM, DVD ROM and Zip drive not possible);

6) does the KMK interface include a special OS ?!? If so, what has been changed there (and what parts of the original Atari OS have been removed/replaced) ?!?

7) does the KMK interface support flash cards or microdrives ?!? (MyIde supports flash cards, msc-ide does not)

8) does the KMK interface work with different DOS systems (like Sparta, MyDOS, Top DOs Prof., etc.) ?!?

9) where can I buy the KMK interface and for what price (in dollars or euros) ?!?

greetings - andreas magenheimer.

As I said, I don't remember as it's been awhile since I used the emulator. Well, yeah, I know, if you attach an ATR to a drive, it works just like a regular disk does! However, if you are working with ATRs that are bigger than the DOS you are using allows, then it won't work right. IE 180k or bigger. These require MyDOS or SpartaDOS! Atari DOSes (2.0, 2.5) will only read 90k, or 1050 enhanced disks. I DO remember that much! So, if you are using MyDOS or SpartaDOS, then you are OK! You CAN read ANY ATR then! BUT if you are trying to use one of the Atari DOSes (2.0 or 2.5), then you will only be able to read 90k or 1050 enhanced and that's about it. You CAN'T read the 16mb ATR's, etc!

There were some major changes made to make MyDOS more compatible with all the other DOSes (Atari, Sparta, etc)! Correct me if I am wrong, MyDOS 3.18 was probably written by someone different than MyDOS 4.53/4, etc. MyDOS 4.53/4 had some major changes to work with emulators, large ATRs, work with disks created from other DOSes, etc. So, yeah, I would think there are major differences between MyDOS 3.18 and MyDOS 4.53/4, etc!

First of all, read the original message, check where the replies are forwarded to. Read "The Anti-Troll"'s message. Google the OP, and check his subjects. You will see TAT is correct. And you will note TAT has changed the follow-ups to thwart the OPs original plan.

Secondly, please do not top-post...

I see what you are saying. This is strange that I am having this issue then.

The problem is made more complicated by the fact that the only Atari I own is an 800. SpartaDOS doesn't run on an 800 so I use BWDOS (Bewesoft DOS) to access SpartaDOS disks. However, BWDOS can't access my original MyDOS 3.18 disks which perfectly readable, or perfect enough to extract all files from most of my disks. A few disks suffer from some kind of media rot after all these years and are totally unsalvageble.

I just tried again. That is I formatted some new 3.18 disks on the real Atari and formatted 3.18 ATRs in Atari800Win Plus. Both BWDOS (800) and SpartaDOS (emulator) complain with an error, SpartaDOS - error 143, BWDOS - 148 (real disk or ATR), when attempting to read. Other than

this problem both DOSes work fine.

Incidentally, SWP (of ATR-8000 fame) supplied the MyDOS builder disk which can create two different versions of MyDOS. 3.18 is created if you wish the ATR-8000 RS232 driver built into DOS.SYS. 3.013 is built if you don't. Do you think this could be the source my issue?

Also, in the emulator I probably built MyDOs 3.013 not 3.18. (Sorry, I typically refer to either version as 3.18 but this is not correct).

Perhaps I should just switch to MyDOS 4.53 all around. I no longer need an RS232 driver anyway.

I'm in no position to argue the point one way or the other since I don't know what is the issue.

RetroJess (sp?) stated that the sector structure, sector links, VTOC, and all conform to Atari DOS 2.0s specs so I can't see what could be wrong only that something is wrong (for me).

Charles Marslett (sp?) devloped MyDOS then eventually released it to public domain. I don't know who has been doing all the recent development (Lee Barnes maybe?).

Every Atari 800 emulator I've tried ZAXXON on exhibits an
annoying artifact which consists of a 'noisy' area near the
top of the screen which seems to follow the players
horizontal position. Has anyone else seen this? Is there a
fix?

>240)

Just as an aside, MyIDE is only limited to 8 partitions (if you don't count the image space which has only the limit of the space on your hard drive.. think thousands of SD/ED disk images available here) because the current software doesn't allow for more to be kept. That includes Mr.Atari's FDISK.BAS and my MyIDECFG program.

Of course there is the fact that you had previously asked if anyone had any for sale, but nobody said they did, and I just happened to put that auction on eBay at JUST the right time.... for both of us, it seems! :-)

Besides, there was the 2nd place bidder that seemed to want it quite badly too, at, iirc, $200, and I've since talked to someone else on this group that actually paid $300 for one!!! He shall remain anonymous though, unless he feels like confessing! ;-)

That is basically what I do except I use 800XLDJ (uses DI image files), a SIO2PC cable, my Atari STe or Atari Clone (Hades060). The A8 thinks my STe or Hades is a disk drive and read/writes from that.

I really can't argue either. I was just trying to help. Guess I am not much help on this subject!

I don't know enough specs on the DOSes that well to help, but I do know how to use them in general and do remember some things about them! I really don't know what the issue is either, now!?

I DO know that MyDOS 4.53/4 or SpartaDOS CAN read DOS 2.0/2.5 disks... for forward compatibility purposes! BUT, correct me if I am wrong, MyDOS and SpartaDOS have a little different format, especially in the VTOC area such as SpartaDOS with the time/date stamps included. MyDOS is different too or in a different area? So if you try to read a MyDOS/SpartaDOS in 2.0 or 2.5, you won't get anything! They are/maybe similiar in structure, BUT they are not really backward compatible! SpartaDOS/MyDOS had code put in to be able to read 2.0/2.5 disks since there were ALOT of them out there and they wanted their DOS to be able to read them as well! I think you can even create (format) new 2.0/2.5 style disks in Sparta?? Don't remember if you can do that in MyDOS, though?

I know there are limitations due to the Atari OS and so that's why some things CAN'T be changed, such as the maximum limit of sectors of a disk/ATR is 65536 (256*256)... the two bytes used to point to the next sector. This, unfortunately, CANNOT be changed... unless you change the OS... and, I think, the sector links HAVE to be in the same place too...125+3 or 253+3 and there always has to be the 3 boot sectors (in SD)! Hence, the need for IDE support!!! :-)

I don't know about the DOS you were using? Maybe whomever did that version made some slight changes that created a compatibility issue? Because, as far as I knew, you COULD read 2.0/2.5 disks in MyDOS. You were talking about ATRs, though? Well, I don't know if MyDOS had support for ATRs back then? I KNOW the current version(s) of MyDOS does have support for ATRs... including the mega images (16mb)! I am not sure about SpartaDOS? I think I had a version created just for the purpose of working on a BlackBox. I don't know if that included reading 16mb partitions or if that had already existed? I think it has had this ability for quite some time before MyDOS did!?

That's about as much as I know about DOSes right now. I could examine each one and break them down and tell you the differences, but I don't have the time to do that right now! BUT I am sure someone probably already knows most of the differences anyways such as Retro does!

So, guess I am not much help on this topic... sorry!

I believe there is a problem with that game in emulation!

As far as I know, there has been NO correction for this one yet... either in the emulator or the game itself?

Professional Software, not Domark... Anyway, the correct title should be Trivia Fever I believe.

We don't have the game in our database either as it really saw limited release. Do you have any way of duplicating the disk at all? I doubt it can really be fixed but you never know... However, if you still have the box, we'd welcome a scan ;-)

Thanks!

> 1) does the KMK interface connect to the XL parallel bus, the XE cart
> port + ECI , the SIO port, the cart port or what ?!?

ECI+CART on XE. An adapter for XL bus is being prepared (AFAIK).

> 2) maximum number of partitions available ?!? (Myide = 8, msc-ide =
> 240)

16 at once (speaking of the "BIOS" level software).

> 3) maximum partition size (standard = 16 Meg.)

8 GB (again, BIOS level software limit).

> 4) does the harddisk then work with files only (under DOS or Gamedos) or
> does it also support disk-images/boot-disks (like MyIDE) ?!?

Difficult question, what is "support for disk images". Certainly the OS
cannot boot from a file (for disk image is a file), it can only boot
from a partition. You can copy the disk image's contents to an empty
partition and boot.

> 5) 16bit or 8bit data transfer ?!? support of other items like CD-ROM,
> DVD-ROM, ZIP drives and such that require 16bit data transfer ?!?

16 bit data transfer. I don't know for ZIP drives, but if the ZIP is
ATA-compliant, it will work.

> 6) does the KMK interface include a special OS ?!?

Nope. It is a self-contained parallel bus device.

> 7) does the KMK interface support flash cards or microdrives ?!? (MyIde
> supports flash cards, msc-ide does not)

If these devices are ATA-compliant, the support is there. If for "flash
cards" you mean so called CFs (compact flash), these have been proved to
work with the interface. Microdrives to my knowledge are CF-like
devices, except that they contain a micro-harddisk instead of flash
memory. Microdrive behaves as CF, and CF card is ATA-compliant. So they
ought to work.

> 8) does the KMK interface work with different DOS systems (like Sparta,
> MyDOS, Top DOs Prof., etc.) ?!?

Yes, the device is not DOS-dependent.

> 9) where can I buy the KMK interface and for what price (in dollars or
> euros) ?!?

Correction:

Closer To Home: telnet://cth.dtdns.net

This works! The first one doesn't seem to work anymore and the second one does work... if you drop the 23. Or at least that's how it works for me, using the regular Windows Telnet client!

You might have to drop the 23 from the others in this list too. So if one doesn't work and it has 23, try dropping it. The 8888 and 8889s are needed so dropping them won't work!

AFAIK or knew (past tense) MyDOS was fully Atari DOS compatible except
for MyDOS' support of subdiretories. I always thought the disk
structures were compatible with Atari DOS 2.0.

I knew nothing about SpartaDOS and don't know much more now. I only
know that *I* was unable to read MyDOS disks using SpartaDOS and vice
versa.

It's not a big problem. It is time to bring my MyDOs up to date,
anyway. Mostly, I'm just curious about the source of the problem.

After re-reading a bit of history of MyDOS I have learned that MyDOS was primarily created for the ATR8000. (I should have known that). I did know that hard disk interfaces were available for the ATR8000 almost from the beginning and Charles Marslett was right on top this with updates of MyDOS. It's the first DOS that I recall which could handle 16MB disk sizes.

ATRs are just files used for Atari disk emulation. There's not much to them. Basically, raw sector data, plus a header at the beginning of the file (16 bytes?). Nothing else AFAIK.

The simple structure makes it possible to emulate any disk, be it a boot disk or a DOS disk (any DOS disk).

Anyway, we are way offtopic.

My appologies to Bill Garber for hijacking his thread.

You are correct - Tom's Hammernode URL does not seem to be working anymore.
I made a note of this on the 'LIST'.

23 is the port designation. The URL:port is merely the way of designating
the port to use. Since 23 is the default port for telnet you don't actually
need it but it was on the list merely for notification puposes. That way
you won't try to access BF2k+ using port 8888.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> selection? (or maybe both?)

Kind of both. First of all, the GAL just contains the bank selection
logic. But since GALs have a "security fuse" which prevents reading
out the logic, it also serves as a (in this case simple) kind of
copy protection.

The bank selection logic of SpartaDos X is very simple and can
be reverse engineered by just looking at the code in the ROM.

But it is possible to implement more advanced protection schemes
using a GAL that are not as obvious as the SpartaDos X logic.

so long,

Hias

> unless he feels like confessing! ;-)

I am the $300 dummy. <sigh> I have had "the fever" really badly and just HAD to have a SDX cartridge but couldn't find one ANYWHERE, including on eBay. Naturally, after I decide to just go for it and buy it they start showing up all over the place for $100-$150 less than I paid! I didn't really NEED it for anything, but I wanted to play with it. And, I wanted to HAVE IT when I learned about the whole piggy back thing. SD, SDX and MyDOS are all new to me - I didn't ever move past DOS 2.5 and the 1050. Learning about Sparta and the XF551 has been a blast!

Now I get seriuosly off topic with this last paragraph, so skip it if you see fit... :)

Anyway, I'm getting over the fever now... Now that I own two Super Archiver 1050 drives, two 5.25" HyperXF 551 drives (many thanks to two frequenters of this news group for the upgrade chips), two Happy 1050 drives and a stock 1050. I have a 3.5" XF551 on its way now, as well, and more thanks to one of these frequenters - I have a 3.5" HyperXF chip to try slapping into that bad boy. Just stuff to play with... I have two 130XEs, one with Tucker's 32-in-1 ROM upgrade and my stock 800XL... I have an 850 interface and the APE/ProSystem cables and software. I have several books now and picked up a few cartridges, including (more thanks) MAC/65 which I never thought I'd end up with. It's been a trip and I've met some very kind and fun people along the way. And then there's the extra 800XL/1050 package I sold and the one currently for sale as well - but I don't count that one in my arsenal since it's all packaged up and whatever... By far the two best investments have been the APE interface and the 32-in-1 OS upgrade. If you don't have 'em, GET 'EM! hehe

Yes indeed, the Odin/Thor stuff (which has just this past month been
denied distribution, and legitimate sites such as WoS have complied
with this) needs to be taken down for a start...

(I posted this before, but some filth seems to have done a forged
cancel...)

Yep, I use 800 and XL and like MyDos 4.5 because it supports
both
Axlon and XE type ramdisks; even converted all of my old 2.5
enhanced
floppies 'cause MyDos won't find any files above sector 720. I
Don't
know much about BW's capabilities; saw it online, but not used
yet.

> I just tried again. That is I formatted some new 3.18 disks on
the real

Sparta ver 1 will only do 2.0S type media in that little file
menu for disk
management. You might send me a 3.018 ATR to play with.

> Incidentally, SWP (of ATR-8000 fame) supplied the MyDOS builder
disk

I would not think so... The differences are in the code and not
in the disk
layout. I have an old 3.011 disk by SWP and a 4.3 from ??.

> Also, in the emulator I probably built MyDOs 3.013 not 3.18.
(Sorry, I

I had never noticed that "0" until just looking at my disks;
Choice depends
on the lomem and the features you need. 4.5 was my first MyDos
when it
went PD.

MyDos 4.5 was IIRC done at least partly by Bob Puff; don't know
what
access he had to Marslett's previous source codes of the 3.1x and
4.3
varieties. Per the 4.5 docs, some of the XIO calls were
configured to give
it compatibility to Sparta, but it was already a 2.0S type file
structure. I am
not aware of any emulator adjustments; it has always had hard
drive
capability which translates to large ATR usefulness.

Hey, Nite;
Sparta and the 2.0S type utilize completely different disk and file structures. MyDos is totally compatible with 2.0S in SINGLE density for reading or writing each other's media except for sector
720 which 2.0 does not use. 2.0 will read a file using sector 720,
but cannot delete it nor overwrite it; it will generate a disk full error.
MyDos is just like 2.0 with 2.5 Enhanced media; it will not see the
<bracketed> files past sector 720. MyDos is really only different from 2.0 when you get to higher capacity storage; there is even a patched 2.0 that will access MyDos files in SSDD. File number tokens, forward sector link pointers and VTOC/Directory structures cause incompatibilities above sector 720 and get worse above 1024.

The ATR, XFD and XLDJ image formats follow their own standards and interface to the various disk and computer emulators; they are
transparent and totally immaterial to which DOS is in use.

the need for
> IDE support!!! :-)

The resident disk handler in the OS is limited to 2 bytes for
zero thru 65535; the sector links and other aspects of the disk
and file structure including the boot sectors are totally a
function
of the file management system (DOS) so complete freedom is
available there. Incompatibility is the only penalty for breaking
convention.

> I don't know about the DOS you were using? Maybe whomever did

before MyDOS
> did!?

My money would be on MyDos; I believe they supported DSDD with
sectors up to 1440 and even larger eight inch floppies on the SWP
ATR8000 before we ever heard of ICD and SpartaDos. The
theoretical
capacity was in place for 16MB before the hardware was available.
OSS DosXL was also doing something similar with Percom higher

capacity drives about the same time.

Sorry, I don't have 3.018. SWP distributions of MyDOS I own are
3.013/3.18 and 3.014/3.19. I seem to have lost 3.011/3.16.

I wasn't able to guess at your email address. Google Groups mask the
last three characters of the nickname of your address.

Email me at Stephen Sheppard at hotmail dot com, no spaces and I'll be happy to send you both of the two versions I do own. Alternatively, you can visit Mathy Van Nisselroy's MyDOS page and find what them. He's added both the MyDOS builder disks I sent him.

The "0" is in all the non-RS232 version numbers. Don't know why the version numbers are out of sync, e.g. the non-RS232 version, 3.013, is paired with the RS232 version, 3.18.

Source record: 12007

A while back I started making some relocatable ML routines in strings that can be called from X=USR(ADR(ML$)) like for instance to relocate the charset and to reserve memory for PM graphics.

Just wondering if there is a known library of useful ML routines that can be called from Atari BASIC?

Hey, I had one of these! It was a REALLY well engineered/designed disk drive enclosure. I sold mine about 12 years ago when I was hard up for cash. Shoulda kept it, alteast the drives themselves anyway! The guy that bought it said he was going to put 3.5" drives in it.. if I had known ahead of time, I would have asked to keep the drives. Quite a collectors item! I know I have one, maybe two of the 3" disks. I think it has DOS XL on it. I should still have the docs as well, let me know if yours doesn't turn up and I'll look for mine!

Well, if there is a GOOD version of this game, sure would be nice to get it!
Maybe the version floating ALL over the internet is the SAME/BAD version...
such as the Crisis Mountain game is... arggghhh!!!

Well, I know that's a port. BUT it didn't work for me! I had to drop the
:23 to access the ones that you have designated with a 23 and so I am merely
mentioning it so that if others try to access these that they too should try
dropping the :23 if they don't work as posted!

It was just an FYI! :-)

There was a commercial one available. I bought it but can't remember the
name right now. About that time I switched over to Action! so I never
produced any programs with the routines.

The "noise" is in the game. I see it using my real Atari 800. The noise also appears at the bottom of screen. It shows up just as noticably on my All-in-Wonder (original) card (connected to 800 via a homemade SVideo cable) as it does in Atari800Win Plus but less noticebly on my television, which overscans slightly (determined by using video test patterns).

I remember a few games of the day exhibited similar problems. IIRC, the explanation was that some programmers did not take into account that some TVs or composite monitors did not overscan as much as others. Programmers either hid or didn't pay attention to things happening in the overscan regions.

Most TVs don't overscan very much today and, of course, emulators don't overscan at all.

I have a workaround for you but you might not like it. In Atari800Win Plus set the graphics mode to 640x400 (clipped) and use fullscreen mode. This will clip off the top and bottom portions of the screen, eliminating the "noise". The clipping does not seem to affect the playability of Zaxxon (for other games it does).

I've always wanted to operate my very own BBS. I think I'll set one up
this weekend and post the URL here.

I used to sysop a BBS for the local Commodore users group many years ago.
That was odd really, cuz I've never owned a Commodore computer in my entire
life. Come to think of it, I wasn't a member of the user group either...
Hey, just how did I become the sysop?

Ah, the simple Commodore users... They just needed an Atari user to come
along and do things right.

Anyway, watch for the URL of my very own Atari BBS... Coming to a newsgroup
near you.

The original disk/cassette version (by John Harris) was released by Sierra.
It was subsequently released as a cart by Parker Bros. It was more or less
the same, sans the musical soundtrack and a few minor variations to the
graphics.

1467. New Atari Web-Page!

Newsgroup: comp.sys.atari.8bit
Date: 2005-03-10 22:19:41 UTC
From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <v_udnbYEhI1gWq3fRVn-gg@adelphia.com>
Source record: 12022

To everyone,
Just an announcement to let everyone know that I just created a web page about 3 weeks ago. I am making it available for all atarians to see. I plan this weekend working on my CAB HOTLIST and removing and adding web pages to bring it up to date. Unfortnately some links dont work anymore and should be taken off. And I have some that are on my MAC that I hope to add to the list. I also plan on doing some other changes as well. If anyone has a link to an atari page and would like to see it added into my CAB HOTLIST or even on my FRONT PAGE let me know. If you want a link as a graphic you must supply the GIF or JPG. Also, if anyone has some cool ideas for improvements to my web-page I am more than happy to read any e-mails or messages on CSAST. Also, does anyone have a cool GRAPHIC they could suggest for my FALCON060 Homepage title at the top of my web page?? The URL to my web page is as follows:

http://users.adelphia.net/~falcon060

Thanks,
Carey Christenson

P.S. E-mail me via the contact at the bottom of my web page. Thanks!!

Get some of the old issues of Antic or Analog (somewhere on the web), and look there. Their BASIC games always contained the exact routines you are looking for. I seem to remember ANTIC in particular, having a middle section that had all the control characters that made up the string that it called from BASIC.

Yeah alot of programs contain ML routines, but I would have liked a
documented libabry of ML routines and preferably relocatable ones for Atari
Basic.

Perhaps I'll start the library with some useful ones I wrote some time ago.

The main items of interest on the controller board are:

MC6809P CPU
FD1797A-02 Controller
MC6809P Async. Adapter

Well, any routines stored in strings would be relocatable by default.
The routines themselves aren't that much, since they are basically
movers (copying default character set to ram) or clearers (clearing ram
for PM graphics).

Other routines could be made to make game programming more accessible to the
Atari Basic user. Like a routine to read the joystick and move a PM player
in the right direction, that sort of thing. Thing is, player movement is
better done during VBI. But other routines like
USR(ADR(UPDATESCORE$,MEMADR,POINTS)) could be used to speedily add points to
a score displayed on the screen, with the rightmost char of the score on the
screen being at MEMADR and initialized to '0's. Things like that would be
nice. Perhaps I'll make this my next ML routine to do.

Anyone else of course is free to offer their routine that can do the job in
the most efficient way speed-wise, and should be relocateable or able to be
stored in an Atari basic string.

I just realized the routine would be much easier to code if the POINTS to
add is specified in string form and with another char say '+' at the end to
indicate the end of the pointsstring. For example to add 125 points you'd
call:

USR(ADR(UPDATESCORE$,MEMADR,ADR("125+"))
```

rather than sending the integer value of 125.

I believe this will allow for faster and shorter ML code than specifying an actual integer value for POINTS.

1476. The latest Atari800Win 4.0 keyboard layout bug?

Newsgroup: comp.sys.atari.8bit
Date: 2005-03-11 15:21:56 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <TGiYd.20747$5T6.18642@bignews4.bellsouth.net>
Source record: 12031

If you do help and keyboard layout, it says the Atari doublequote is assigned to pc key doublequote but it really looks like its assigned to pc key @ which is shift-2 like on real atari's.

Did they change it and not update the help -> keyboard layout option?

Or maybe I'm using a non-standard keyboard template? However I see nothing in the keyboard template to re-assign the doublequote.

Apparently it's the default.a8k template I was trying to use...I unchecked
"use keyboard template" and all is good again.

kinda related...it's better to reserve memory for PM graphics before
reserving memory for a custom charset, right? Something to do with the PM
graphics requiring a page boundary or something?

Hi everyone,

I'm looking for a copy of Atari's "The Learning Phone" cartridge from 1985, with documentation.

I can't find anywhere online that sells this cart, so I'm asking in here.

Let me know! Thanks!
FST

There are three that I know of. The most complete was a commercial
product called "BASIC Turbocharger" published by Alpha Systems. It
was a book + disk, and had an optional source code disk. Not all were
relocatable as I recall -- I think a lot of them went on Page 6.

An earlier product was "Page Six" by Synapse. I don't recall much
about it.

The last was a "Shareware" product called "Basic Powerpack". It is
widely available.

If I recall correctly, I may have purchased such a disk from the old
Bellcom public domain library. If so, I still have it. Although, I
have no idea how I would upload it, as I have no way of connecting my XL
to the net. I haven't even built myself an SIO2PC cable yet.

I'll take a look through my old Bellcom catalogs later and see. If I
have it, I'll see if I can find some way to upload it. I would assume
that this stuff is already floating around the internet somewhere
though.

If you locate the bellcom disk in your catalog that has what is looked for,
I have about 900 disks, but I don't know which one it is. (The disks are in
the Holmes CDs.)

1492. 810 drive - Proper power supply?

I recently purchased an 800XL w/ 810 floppy drive on Ebay. The computer works fine. (I even managed to make the internal mod to allow display through the S-Video input on my TV!) However, the 810 drive doesn't want to spin up.

I think the power supply that came with the drive is not the correct one. While the power light on the drive comes on, the drive barely groans. The spindle doesn't rotate, etc. I flipped the power supply over and see that it is a Model # CO4319, 9 Volt AC and 15.3 VA rating. This works out to only about 1.7 amp. That doesn't sound right at all for this old monster floppy drive.

1) What is the correct AC output and correct amp rating for a power supply? I just might have something laying around that I can adapt.

2) Also, please tell me the correct original Model # is for the 810 power supply - so I can look for one.

Thanks for any help!

Chicago Pete

Some of those do not exist anymore and I believe Stephen's is not on that
web list at all.

It should be 9V AC, 3A, 27VA power supply.

Jurek.

My laptop requires two keys to use the emulated numeric keypad. I
would like to use the arrow keys. My laptop is running Gentoo Linux.
I have looked at the sourcecode and found definitions that indicate the
numeric keypad as well as A=left D=right X=down W=up. What do I need
to change to set the arrow knothingeys as directional movement? A,D, X
and W seem to do nothing. And I must have missed fire being defined...
I tried -mouse joy but mouse movement seems to haqve no effevt either.
Any help would be appreciated.

You're right, CO14319 is too weak for disk drives.

CO17945 (3.4 amps) is the usual model used with the 810.

From the FAQ:

9 V AC 15.3 VA (1.7 A) Atari#CO14319
400,800,822,850,1010,1200XL

9 V AC 18 VA (2.0 A) Atari#CA014748/CA016804
400,800,822,850,1010,1200XL,810

9 V AC 31 VA (3.4 A) Atari#CO17945
400,800,822,850,1010,1200XL,810,1020,1050,XF551

9 V AC 50 VA (5.6 A) Atari#CA017964
400,800,822,850,1010,1200XL,810,1020,1050,XF551

Ive just purchased a 1050 disk drive from eBay but it doesn't contain a dos
disk (so I believe)
Is this going to be a problem for me or are they easy to get hold of???

Regards

Scot Jones

Got an email from someone who's trying to figure out a game he played at one time. He's not completely sure which particular Atari system he played it on though. Here's what he provided:

> >Hi there. I wish to purchase from you an atari, but i have several problems:

> > I'm looking for a specific game i used to play when i was young. Description of the game: You
> > start walking upwards in a lane, until you reach a house. if you walk on the

> >Do you know the name of the game, or where i can look for it (since i need to be sure that the atari model i buy is compatibe with this game).

The only things that remotely come to mind for me on the 8bit system would be:

- Hi-res Adventure #1 Mystery House or #3 Cranston Manor

- Zork series

- Scott Adams graphic adventrues (maybe)

Anyone have any ideas what this game may be, either on 8bit or 16bit Atari systems? It sure would've been helpful if he at least mentioned how long ago he played it.

Thanks for the help.

Glenn

Yeah you need one of those! There are actually several different ones I use
regularly. DOS 2.5, MyDOS, SpartaDOS. They can all be downloaded, but to put
them on disk you'll need something like a 1050toPC cable adapter to hook
your 1050 to your pc and write disks. Thats the most valuable 8bit tool I
have. They can be found on Ebay.

Umm... where did you get Atari800Win 4.0? The most current versions
I've found are a much lower revision than that.

In article <TGiYd.20747$5T6.18642@bignews4.bellsouth.net>,
bcozier@bellsouth.net says...
> If you do help and keyboard layout, it says the Atari doublequote is
> assigned to pc key doublequote but it really looks like its assigned to pc
> key @ which is shift-2 like on real atari's.
